IN MEMORIAM

Thomas B. Sullivan, First Assistant Superintendent of Banks of the State of California for the past eleven years, died on September 16, 1922.

In his capacity as First Assistant Superintendent of Banks he was ever watchful of the safety of the banks of this state and had in mind the security of the savings bank depositors at all times.

He was a member of the California Bar Association and a thorough student of banking, both in its technique and theory.

Through the passing on of Mr. Sullivan the Banking Department, as well as the people of the State of California, have lost a just and able public servant.

JONATHAN S. DODGE.

The members of the Legislative Committee of the California Bankers Association unanimously requested their chairman, at a conference of the committee with the State Superintendent of Banks on October 10, 1922, to express on their behalf the appreciation of the bankers of the state of the services performed for banking in California by the late Thomas B. Sullivan. John S. Drum, Chairman of the Committee, said:

"Thomas B. Sullivan did his work well. Before entering the office of the State Superintendent of Banks he had been first a brilliant student at the University of California and later a brilliant reporter on the San Francisco newspapers. He studied law while engaged in the newspaper business, and in 1911 entered the office of the State Superintendent of Banks as one of his attorneys.

"From the beginning down to the time of his death, serving with three successive superintendents of banks—Mr. Williams, Mr. Stern and Mr. Dodge—he gave to his work a broad knowledge and constructive intelligence that have meant much to the development of sound banking in California.

"During his service the State Superintendents of Banks and the Legislative Committee of the California Bankers Association looked to him for the proper expression and form of legislation written into the State Bank Act, and his judgment and experience influenced greatly the adoption of many of the amendments made from time to time to this act.

"Mr. Sullivan was modest in his attainments and at the same time strong in his convictions. The decade of his work in the office of the State Superintendent of Banks exercised a most forceful influence directed toward sound banking practices and thereby was of great constructive aid in the development of the State of California and its resources."

THIRTEENTH ANNUAL REPORT
OF THE
Superintendent of Banks
OF THE
State of California

1922

Showing the Financial Condition of State Banks
at the Close of Business June 30, 1922

JONATHAN S. DODGE
Superintendent of Banks

CALIFORNIA STATE PRINTING OFFICE
SACRAMENTO, 1922

SUPERINTENDENTS OF BANKS OF CALIFORNIA.

ALDEN ANDERSON :

Appointed July 1, 1909; appointment terminated February 20, 1911.

W. R. WILLIAMS :

Appointed February 20, 1911; resigned November 30, 1918.

CHARLES F. STERN :

Appointed December 1, 1918; resigned June 20, 1921.

JONATHAN S. DODGE :

Appointed June 20, 1921; incumbent.

INTRODUCTORY LETTER.

October 18, 1922.

His Excellency, WILLIAM D. STEPHENS,
Governor of the State of California,
Sacramento, California.

DEAR SIR: I herewith submit the annual report of the Superintendent of Banks of the State of California, pursuant to section 140 of the Bank Act. This is the thirteenth annual report under the present law and the second under the present Superintendent of Banks.

The figures here given are those of the fiscal year ending June 30, 1922.

The history of California banks is one of development in methods of sound finance, of expanding opportunities in commercial organization, of the establishment of right principles of government in the conduct of these institutions and of the existence of strictly defined and rigorously enforced limitations established by considerations of safety.

The year began with an undoubted improvement in the credit condition. The financing by our banks of various products carried over from the preceding year was no longer necessary. As a result the banks were relieved by the large proportion of self liquidating accounts and thereby increased their resources available for new production and new business.

During the first part of the fiscal year there was a relative stability of prices which indicated a fixed price level and which gave a feeling of certainty to business. A positive foundation had been met upon which to build a sound structure of banking and business.

The year, therefore, in its brighter aspect was constructive and not simply conservative, taking the form of larger banking accommodations, easier money and better prospects of business and economic development. Our savings kept growing and the liquidation of our frozen agricultural loans has been rapid. There has been more capital available for investment; established industries have received more substantial support, and the needs of trade have been better supplied.

Our farmers have been subjected to the difficulties of readjustment but they have liquidated a good proportion of their loans and received good prices for their crops.

During the year business men found it possible to go forward upon a more stable price basis; as a result there was more assurance of reasonable profits and returning prosperity.

During the year a turning point came in a definite reaction against deflation. The improvement in great fundamentals, in interest rates,

in liquidation of bank credits, in the reduction of accumulated stocks of commodities and comparative stabilization of prices was the outstanding feature of the year.

The coast farmer will be greatly benefited by the plan of financing the farmers of the territory west of the Rockies by the five Joint Stock Land Banks, four of which are now in process of organization.

The five Joint Stock Land Banks have a total loaning power of \$60,000,000 and will not only serve the farmers of California but those of Arizona, Oregon, Washington, Idaho, and Utah, which comprise the general territory of the Twelfth Federal Reserve District.

ENORMOUS INCREASE IN WEALTH OF STATE BANKS.

During my administration the growth of state banks has been remarkable. At the close of the fiscal year 1922, California was fifth in the United States, exceeded only by New York, Pennsylvania, Illinois and Massachusetts, in the aggregate of the resources in banks under state jurisdiction. A comparison of essential banking items may be made as between the called report of June 30, 1921, and that of June 30, 1922. As of the first date, the total of assets in California state banks was \$1,496,036,458.94. Of the second date that at the end of the fiscal year June 30, 1922, the amount of assets in the state banks is \$1,657,940,264.57, an increase during the period under consideration of \$161,903,805.63. Individual deposits at the call of June 30, 1921, were \$1,242,233,034.62. Individual deposits at the call of June 30, 1922, were \$1,363,681,887.22, an increase of \$121,448,852.60. Of this total of individual deposits at the 1921 call \$329,783,562.15 were commercial deposits and \$912,449,472.47 were savings deposits. At the call of June 30, 1922, the total deposits are divided as follows: Commercial deposits \$392,646,500.22, showing an increase during this period of \$62,862,938.07. Savings deposits \$971,035,387, an increase of \$58,585,914.53.

The total loans and bankers acceptances on June 30, 1921, were \$886,270,473.05. At the call of June 30, 1922, the aggregate is \$978,752,712.33, an increase of \$92,482,239.28. At the call of June 30, 1921, the bonds owned by state banks amounted to the sum of \$367,043,060.33. At the call of June 30, 1922, the total of bond holdings was \$392,838,593.55, an increase of \$25,795,533.22. At the call of June 30, 1921, the capital stock of the state banks, paid in, was \$95,409,145. At the call of June 30, 1922, the total capital of these institutions was \$100,065,270, an increase of \$4,656,125. At the call of June 30, 1921, the total surplus of all banks in this jurisdiction was \$43,355,665.36. At the call of June 30, 1922, the aggregate was \$43,096,759.41, a decrease of \$258,905.95. At the call of June 30, 1921, the total undivided profits was \$13,344,758.25. At the call of June 30, 1922, the gross amount of undivided profits was \$16,408,414.76, an increase of \$3,063,656.51. At the call of June 30, 1921, the total bills

payable was \$17,839,429.04. At the call of June 30, 1922, the total was \$6,434,658.38, a decrease of \$11,404,770.66.

The foregoing facts briefly outline the enormous growth of the state banks in wealth and in banking power during the year just closed. The records show an expansion of assets, a well conditioned relation between loans and discounts on the one hand and deposits on the other, and a satisfactory development in the practice of our theory of savings bank investments.

During the fiscal year the state banks increased their paid in capital in the sum of \$4,656,125. The additions to the item were in part required by the immense increase in the aggregate of deposits and the requirement that a fixed relationship must be maintained between capital and surplus on the one hand and deposit liability on the other.

SAFETY DOMINATES OUR SAVINGS BANKS.

The character and strength of the California system of banks may be expressed significantly by contrasting their essential figures with the primary elements as follows: On June 30, 1922, the combined assets of the state banks of California were \$1,657,940,264.57, an increase over the previous year of \$161,903,805.63. Taking the same date as the basis for a discussion of parallels, the facts are as follows: At the close of the fiscal year June 30, 1922, the combined assets of savings banks and savings departments of departmental banks were \$1,092,489,605.39, an increase over the previous year of \$86,437,721.73. The aggregate of loans and discounts in our savings banks and savings departments was \$644,251,615.03, an increase of \$68,857,235.09.

During the fiscal year the savings banks increased their holdings in bonds in the sum of \$17,527,298.08, making the aggregate \$307,941,198.32.

One of the substantial items in the resources of the savings banks of the state is their investment in banking premises. At the close of the fiscal year it represented an aggregate value of \$29,095,805.73, an increase of \$2,365,026.90.

The investment of these banks in other real estate, most of which has been taken for defaulted debts, was at the close of the year \$5,030,207.17, an increase of \$488,152.84.

The deposits in the savings banks increased during the fiscal year in the sum of \$58,585,914.53.

At the close of the fiscal year June 30, 1922, the savings banks of California were capitalized in the sum of \$38,646,050, an increase of \$2,036,950 for the fiscal year. For the same period the savings banks had in surplus \$24,256,935, an increase of \$590,890.88. At the close of the fiscal period these banks had an aggregate of \$7,417,456.95 in undivided profits, an increase of \$2,373,563.79.

During the fiscal year the depositors of the savings banks of California increased in the number of 143,195, giving an aggregate of savings depositors in the state of 1,736,285.

Compared with the report of June 30, 1921, the condition of the savings banks and savings departments of departmental banks of the state system at the close of business on June 30, 1922, expresses the following facts:

Savings Banks and Savings Departments.

THE STRENGTH AND GROWTH OF COMMERCIAL BANKS.

In analyzing the condition of our state commercial banks and commercial departments of departmental banks in those relationships that mean solvency, liquidity and ability to distribute properly the credit of the communities in which they exist, we find that these institutions have made major increases in capital, undivided profits, loans and discounts, cash on hand and in individual deposits and showed a decrease in bills payable.

At the close of the fiscal year June 30, 1922, the aggregate of loans and discounts in our commercial departments and commercial banks was \$323,380,213.81, an increase of \$33,653,074.39. The combined assets of commercial banks and commercial departments were as of the close of the fiscal year \$555,518,907.71, an increase over the previous year of \$76,178,393.35. At the close of the fiscal year cash on hand in these institutions was \$19,887,360.18, an increase of \$1,016,080.72.

During the fiscal year our commercial banks and commercial departments of departmental banks had an aggregate of \$21,876,848.06 due them from the Federal Reserve Bank of San Francisco, an increase of \$6,080,076.66.

During the fiscal year individual deposits in these institutions reached an aggregate of \$392,646,500.22, an increase of \$62,862,938.07.

During this period our commercial banks and commercial departments of departmental banks increased their capital in the sum of \$3,037,075, making an aggregate of capital in these institutions of \$54,099,220. In this fiscal year the depositors had increased in number 122,055, giving an aggregate of commercial depositors in the state of 795,339.

The facts and figures of our commercial banks and commercial departments of departmental banks for the fiscal year that ended on June 30, 1921, as compared with the fiscal year ending June 30, 1922, are summarized and tabulated as follows:

Commercial Banks and Commercial Departments.

	June 30, 1921	June 30, 1922	Increase	Decrease
RESOURCES.				
Loans.....	\$289,727,139 42	\$323,380,213 81	\$33,653,074 39

Total number of depositors.....	673,284	795,339	122,055	

*Not included in totals.

AN ESTABLISHED FAITH IN OUR TRUST COMPANIES.

The same notable elements of success that have attended the activities of savings banks and commercial banks of the state system are evidenced in the facts and figures that describe the trust companies and the trust departments of departmental banks for the fiscal year. The institutions which are simply and explicitly of a fiduciary nature have increased their capital and surplus to meet their obligations. Compared with the report of June 30, 1921, the condition of trust companies and of trust departments of departmental banks of the state system at the close of business on June 30, 1922, expresses the following facts:

Trust Companies and Trust Departments.

	June 30, 1921	June 30, 1922	Increase	Decrease
RESOURCES.				
Loans.....	\$1,916,336 65	\$2,070,432 46	\$154,095 81	
Bonds, warrants and other securities.....	6,421,294 62	5,814,919 29		\$606,375 33

STATISTICAL FACTS AND FIGURES OF STATE BANKS.

During the year ending June 30, 1922, seventeen national banks with three branch offices sold their assets and transferred their deposit liabilities to state banks. The national banks thus ending their affairs and preserving the continuity of banking functions in the state system possessed a capital of \$2,500,000 and a surplus of \$914,000, assets of \$33,024,000 and gross deposits of \$27,140,000.

During the same period two state banks went into the national system. These state banks finding their expression in the federal system possessed a capital of \$150,000, a surplus of \$55,000 and assets aggregating \$1,358,000, and deposits of \$1,127,000.

During the period ending June 30, 1922, thirty-six state banks were organized, making a total of four hundred and twenty-nine state banks operating under the laws of the State of California.

At the close of business on June 30, 1922, there were 429 state banks with 281 branch offices. Of these 67 are commercial banks, 99 are savings banks, 7 are trust companies, 232 are commercial and savings departmental banks, 24 are commercial, savings and trust company banks.

Six banks changed their names. There were at the close of the fiscal year 2,531,624 depositors in the state banks, a gain of 265,250 depositors for the year. State banks reported an aggregate sum of \$140,639.72 in unclaimed deposits of more than twenty years standing and subject to escheat.

The foregoing facts briefly outline the common growth of the state banks in wealth and in banking power during the last year.

The prosperity of the productive agencies of the people was reflected in the development and expansion of the banks and the extension of their credit organization and in the enlargement of their banking power.

During the fiscal year 36 new banks and 113 branch offices were licensed. Eleven banks extended their activities by adding new departments; of these six were commercial departments, four were savings departments and one trust department. Three banks and nine branches were voluntarily closed. These results were accomplished either by sales to going institutions or by consolidations that give to the communities interested greater and more centralized banking facilities. Eight banks entered the Federal Reserve system; fourteen banks and nine branch offices were sold and eight banks with one branch office became extinct by consolidation. Three banks with five branch offices merged and one national bank converted into a state bank. Fifteen banks increased their capital stock, while one decreased its capitalization.

During the fiscal year calls for report of condition were issued for September 6, 1921, December 31, 1921, March 10, 1922, May 5, 1922, and June 30, 1922.

BRANCH BANKING.

Branch banking under certain conditions and limitations has been so long permitted and practiced under the laws of this state as well as in other countries and states, that it can no longer be considered an experiment. There is no doubt but that under proper restrictions it has its advantages and enables strong institutions to afford banking facilities in localities which would otherwise be without them. The

location of a branch office or the establishment of a new banking institution in a locality where there is a real need for banking facilities not only benefits the residents of the section or locality but it is of importance to the business and commerce of the state and of the country as well. It not only prevents hoarding with its attendant risk of loss through fire or robbery, but brings the funds which would have been hoarded into general circulation and public use.

STANDARDIZED CREDITS.

A significant development in the larger banks has been the creation of standardized credit organizations. Branch banking extends the benefits of this service to the smaller communities. Borrowers receive the accommodations which their statements justify and healthier business conditions are promoted by the establishment of standard credit requirements which have been proved by experience.

In establishing the system of branch banking in California an attempt has been made to introduce into banking certain methods and policies which have had a successful application in other lines of endeavor. While it can not be said that branch banking in California is better than the existing system elsewhere or that it is equally adaptable to other sections of the country, it may be predicted that branch banking will stand or fall dependent upon the extent or quality of service it can render to the public.

LIQUIDATION PERFECTED.

I am pleased to report that all of the assets of state banking institutions that failed in the last ten years have been distributed and their obligations, as far as they could be paid, have been satisfied. It is encouraging, therefore, to report to you that the books have been closed with reference to the wrecked institutions. I have transmitted to the state treasury during this past year the sum of \$92,646.77 as unclaimed deposits in liquidated banks.

BOND INVESTIGATIONS AS A SAFEGUARD TO SAVINGS BANK INVESTMENTS.

The duty of safeguarding savings bank deposits plays no small part in the administration of my office. It is not necessary for me to inform you that these deposits are the savings of a lifetime of many of the citizens of this great commonwealth, and must be protected to the utmost of our ability. With this object in view we must carefully perceive a manner in which these funds might best be placed to upbuild this great state of ours and at the same time afford a measure of safety justly required.

I will briefly refer to some of the securities which are considered of a character adequate to support an investment of funds by a savings institution.

During the past few years irrigation farming has proved itself and is now recognized as one of the most powerful resources of California. It has had much to do with the development of the arid lands of our state. Land values have increased by ten times their value over a period of years. While taxation has somewhat increased, yet it is not burdensome because of the enormous yield resulting from the application of water at the proper time.

It has resulted in a yearly production of diversified crops, and increased agricultural and farm output.

This manner of farming has reached a peak where it has come to stay. It has been tried and proven to be the success which was prophesied for it in the beginning. My close relation to this work is brought about because of my membership in the California Bond Certification Commission, whose duty it is to see that this great work of irrigation continues to operate in a safe manner and to afford to the vast areas of undeveloped lands in our state the same opportunity to achieve the earning capacity of those under irrigation systems. My principal concern with these organizations is their physical condition, management, control and manner of financing.

The California Irrigation District Act permits the districts to finance themselves through the medium of bond issues, and at the same time restricts the purposes for which these issues can be created. These securities are payable by annual taxation levied against all the real property situate within the district. Subsequently with the creation of this debt the bonds then establish a lien on the lands superior to all others which might be created.

Bonds issued by the districts are placed in the same class as municipals by many of our experts. Because of the strong financial position which they have attained in our state and of the realization by the eastern states of the intrinsic value back of these bonds, they are now in demand on their market, a recognition which had long been denied them.

PUBLIC UTILITY BONDS.

The public utility bonds of this great community of ours are a credit to it. They have been accredited with having done much toward the development of our state and justly so. It has been their sound economic methods which have developed the hydro-electric energy of our state until it now ranks among the leading states of the Union in the development of water power.

Companies of this character have adopted as a major method of finance the issuance of bonds. A very large majority of these corporations come before my department for the certification of these securities as eligible for savings bank investments. A very careful examination into the earning capacity and the physical condition of

their franchises is then conducted. It is only from this careful scrutiny that I am able to state decisively my opinion as to the eligibility of these bonds for savings funds.

REAL ESTATE BONDS.

During the past few years there has been a growing demand for funds, through the medium of bond issues, for development of agricultural land. This manner of financing is looked upon with favor by my department, if the project be worthy of consideration. Issues of this character are considered solely on their merit and ability to meet interest and principal payments from the yield of the land.

Within the fiscal year closing June 30, 1922, I have made eligible for investment by savings banks an aggregate of \$161,100,877 in bond issues. The California Bond Certification Commission, of which I am a member, has made legal for investment by these institutions bonds in the amount of \$15,182,000, making a total of \$176,282,877 in legal bonds. Included in this total there is an aggregate of \$3,061,177 representing district, road, reclamation, drainage and municipal improvement bonds. There is also included real estate bonds issued in amount of \$20,997,000. Making up the balance of bonds certified by me we have public utility bonds in an amount of \$137,042,700, a majority of which were for hydro-electric development.

The Bank Act automatically permits savings banks to invest in governmental, state and municipal bonds and bonds of other political subdivisions of our state and various other states of the union. The banks have invested an enormous amount of their funds in securities of this character. The balance of available funds are expected to find lodgment in those issues which have been certified. To this our savings banks have cheerfully responded and as a result they are earnestly doing their share toward the upbuilding of California.

PROPOSED NEW AMENDMENTS TO THE BANK ACT.

No changes have been proposed in the bank act which might affect it in any fundamental principles. The provisions which have insured the safety and soundness of our state banks should be continued, as the bankers themselves as well as the public at large recognize the necessity for adequate legal regulation and protection of the business of banking. Such changes as have been proposed are designed to improve the mechanical operation of details in the administration of the act and also to recast certain sections in the interests of clarity and simplicity.

A change is desirable in the provisions which govern our state banks in the accepting of public funds. As the statute now is, state banks are not permitted to give security for any public funds except such as fall within the category of state, county or municipal deposits. There are however certain governmental political subdivisions, such as water

districts, drainage districts and the like, which are required by their governing statutes to take security for any money which they may deposit in banks. It is proposed to enlarge the provisions of our statute to permit the taking by our state banks of "The public funds of the State of California and the counties, cities and towns in said State of California, and of any governmental or political subdivision of the State of California, the funds of which are required by law to be secured if deposited in banks."

An important factor in the financing of our western states is the creation of Federal Land Banks and Joint Stock Land Banks. In order to broaden the investment field of our savings banks, to which we must necessarily look for the financing of permanent investments, it seems desirable to provide for the legality of investment by savings banks in not only Joint Stock Land Bank bonds but other bonds of a similar nature issued under authority of the United States, together with certain other securities which are considered sound investments but which are not now legal investments for savings banks by reason of the restrictive wording of the statute. It is proposed to broaden the present provisions by permitting savings banks to invest not only in bonds or interest bearing notes or obligations of the United States or those for which the faith and credit of the United States are pledged for the payment of principal and interest, but also those issued under the authority of the United States. There is also a class of prime, high class investments not now available to our savings banks, which will be provided if our investment provisions shall be made to include "bonds legal for investment by savings banks in the State of New York."

It is proposed to change slightly the wording of sections 61 and 84 of the Bank Act in order to harmonize their provisions regarding investment in bank premises, furniture and fixtures and safe deposit vaults. Our banks are also permitted to invest in certain classes of stocks and there is a possibility that further permission may be extended by statute to banks to purchase stock in Joint Stock Land Banks.

It is proposed to limit the character of all fixed capital investments which a bank may acquire, including bank premises, furniture and fixtures and safe deposit vaults, together with all of the various stocks which represent participation in auxiliary investment activities, to a total not exceeding the paid in capital and surplus of the bank.

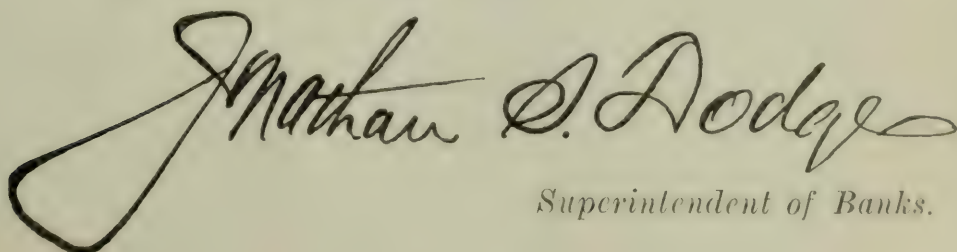

The rapid growth in volume of assets in our state banks, combined with accelerating expansion of branch office banking, has brought about a situation which overtaxes the present resources of the department in the endeavor to provide the supervision necessary for the safety and further development of our state banks. An increase in the income of this department is imperative if it is to continue to function at the high

standard which has hitherto been successfully maintained. A change in the basis of assessments on our state banks for the support of this department is suggested which will be more equitable in its application and which will provide a fund that will automatically increase in accordance with the growth of our state banks. The present method of assessment, based on the statutory requirement that a fixed amount be collected annually, provides no means of growth for the department. The present assessment is that of a proportional amount of the capital and surplus of each bank. As the larger banks are not obliged to provide the same proportional amount of capital, in relation to deposits, as are the smaller institutions, the present arrangement is proportionately the most burdensome upon the banks having the highest ratio of capital to deposits. In most cases this includes practically all of the smaller banks. As a more equitable alternative to the present arrangement, it is suggested that each bank pay annually into the State Banking Fund a proper percentage of its total resources as shown by its last report to the superintendent of banks, providing, however, that no bank shall pay less than a certain minimum assessment and that each bank having a branch office or branch offices also pay an additional assessment for each branch office. The proposed method and percentage of assessment will permit the establishment of a field force more nearly adequate to our present needs and permit of expansion as the needs of our supervision require.

Appended hereto and made a part of this report are the following:

1. Summary of condition of every state bank.
2. List of new banks and branch offices.
3. Name and compensation of each person employed and the whole amount of receipts and disbursements of the department during the fiscal year.
4. Miscellaneous changes in banks.
5. Reports of deposits unclaimed for more than twenty years.
6. Banks authorized to make collection of savings from school children.
7. Tabulated statement of condition of banks.

Yours very truly,

A large, flowing handwritten signature in dark ink, reading "Nathan S. Dodge". The signature is written in a cursive style with long, sweeping strokes, particularly in the first and last letters of the first and last names.

Superintendent of Banks.

Note.—Only true applications are shown.

Up to September 1, 1922 a total of 2003 applications have been filed with the Division of Water Rights since the Water Commission Act was passed in 1913. Of these 927 have been cancelled applications from the total before 2750. Subtracting the true from each one of these is shown by an approximately equalled to an approximately equalisation of a large key map of California in the office of the Division of Water Rights measuring 12" x 15" and drawn on a scale of 1 inch to one inch.

ORGANIZATION 1922

PLATE 1.

REPORT OF DIVISION OF WATER RIGHTS OF STATE DEPARTMENT OF PUBLIC WORKS.

NOVEMBER 1, 1922.

CHAPTER I.

INTRODUCTION.

The Department of Public Works was created by an act of the 1921 legislature, which became effective July 29th of that year. By the terms of this statute the State Water Commission, as such, was abolished and its functions and duties under the Water Commission Act became the functions and duties of one of the divisions of the new Department of Public Works, namely, the Division of Water Rights.

This report concerns the activities of the office since the last biennial report of the State Water Commission, and covers the period from September 1, 1920, to September 1, 1922. During the first part of this time the work was carried forward under the supervision of the Water Commission, and during the second part under the supervision of the Chief of Division of Water Rights, who in turn is responsible to the Director of Public Works. This change in name has caused some difficulty in writing the report because reference is made continuously to the Commission or the Division as the case may be, and some confusion may be caused unless it is understood that the former refers to the organization prior to July 29, 1921, and the latter to the organization subsequent to that date. The office, however, functions under the definitions of and the authorities conferred by the Water Commission Act (chapter 586, Statutes 1913).

History.

The history of the Division of Water Rights and of the State Water Commission and the reasons for the establishment of the office go considerably farther back than the enactment of the Water Commission Act in 1913. Legislation along this line was proposed more than forty years ago, but it was not until about 1900 that the movement made much progress. There was an awakened desire for water supplies for irrigation about this time, influenced probably by the occurrence of a cycle of dry years. The perplexing status of California water law, however, and its general inadequacy, recognizing as it did the two conflicting doctrines of prior appropriation and riparian right, was a bar to progress, and there grew up an insistent and increasing demand for a water code under which development could proceed. A code similar to those adopted by other western states, and which had been exceptionally successful, was proposed, and soon after 1900 an attempt was made to have such a law enacted. There was determined opposition to such change, however, by the holders of vested water rights, particularly by riparian owners, and the movement failed. This situation was peculiar to California, as the other western states do not recognize riparian rights to a material degree.

The demand continued, however, and in 1913, due to the efforts of several earlier boards and commissions, the present Water Commission

Act was adopted by the legislature, and after being held up by referendum, was passed by vote of the people at the general election in 1914, and became effective December 19th of that year. The Commission was immediately organized, and it and its successor, the Division of Water Rights, have functioned as described in the succeeding chapters of this report. The office was at first maintained in San Francisco. However, early in 1922 it was moved to Sacramento and is now located in the Forum building in that city, where are also the several other divisions of the Department of Public Works.

Purpose of Law.

The true purpose of the Water Commission Act is to provide the legal machinery by which new vested rights to the use of water may be acquired, while at the same time rights which have already vested by use may be protected in their use of water. All new rights by appropriation must be acquired through the procedure required by the act and hence, through the supervision exercised by the Division of Water Rights, a complete record, valuable to both the state and the applicant, of the progress from the time of filing until use of the water is made is available, and when question arises there is little difficulty in finding from the record exactly what has been done. Chapter II gives a fairly complete description of the functioning of the office in recording these applications.

Rights which had vested prior to the Act are not so easily ascertainable, for there is no such record. Information as to these rights is continually sought by the Division by asking their owners to place their claims on record when a new appropriator on any stream applies to the Division. By means of the protests and supporting data filed in this connection, a great deal of information is being acquired and recorded as to the older rights, but this is at best fragmentary. To remedy this lack of knowledge as to the older rights, it has been provided in the act that a body of water users may ask the Division of Water Rights to survey all the irrigated lands on a stream and measure the diversions and thus determine the facts as to what rights have vested. In addition, by means of testimony and whatever records are available, the Division determines the date when such diversions were first made, and thus establishes their relative priorities. When such information has been completely gathered, the court may enter a decree affirming or modifying the same, and the whole proceeding then constitutes what is called an adjudication of these rights.

By this method the facts as to rights which have been acquired prior to the act are gathered as fully as is possible and after such a survey a complete record exists of all rights on the stream, both old and new. Although authorized to make such determination of old rights on its own initiation, the Division and its predecessor, the Commission, have never exercised such authority. However, on petition of the water users, it has thus determined, or is in process of determining, the rights on four streams involving 182,000 acres of irrigated land. Similar determinations have been made, in a somewhat less formal manner, on five streams involving 7700 acres of irrigated land. This last is by court reference, whereby the court, when a case involving water rights is before it, may refer the determination of the facts to the Division of

Water Rights. A narrative of these adjudications and court references is given in Chapter III.

Division a Fact Finding Body.

It will be thus seen that the largest function of the Division of Water Rights is as a fact finding and recording body. For new appropriations it keeps a complete record of all pertinent matters leading up to the vestiture of a water right, both in the office and by field examination. For old rights it determines the facts by field investigation and testimony.

In any legal controversy over water it is most often the questions of fact which are in issue. Such questions are also in issue constantly before the Division of Water Rights. Whether or not the Division has any quasi-judicial function, it can, if it is in possession of the facts regarding conditions on a stream, make known these facts to the interested parties in the issue and the matter is then susceptible of compromise, and no fair solution is possible if the physical facts are unknown. The Division is authorized to make such investigations of conditions in a more informal way than either an adjudication or a court reference, and has been requested to do so in a number of cases with funds furnished by parties in interest. These various investigations are discussed in Chapters V, VII and VIII. The investigation which has been of greatest importance, and has accomplished the greatest result, has been on Kings River, discussed in Chapter VII.

Kings River Investigation.

The question of the amounts of water diverted by the numerous canals diverting from Kings River had been in controversy for many years. Before such controversy could be settled it was necessary to determine the facts in the matter. Such a determination could be made only by painstaking continuous records of the diversions which were being made. Such a record has been now in progress for five years and most of the matters formerly in controversy are no longer subjects of dispute.

A digression here may be pardonable. It would be impossible to over-emphasize the importance to the state of the progress toward amicable settlement of disputes which has been made by the Kings River interests because they have seen fit, in the manner noted, to remove from the domain of controversy the facts as to the amounts of water being diverted.

This has led to another important step. The waters of Kings River are being distributed by a watermaster in accordance with a schedule worked out from the information gathered in the investigation. This is an important step in advance, for, after all, the object of all water law is to provide adequate means so that the owner of a vested right may receive the water which belongs to that right with the minimum of effort on his part and with no fear by reason of adverse claimants.

Distribution by Water Master.

All records in the office of the Division of Water Rights are made for that end, all facts gathered in adjudications are also to that end, all facts gathered in any investigation are gathered for that purpose.

But gathering the facts alone does not always accomplish the result in times of water shortage. Water in streams continually changes its position, and to ensure that a requisite amount reaches the owner of a vested right the conditions, which change from day to day, must be constantly observed. Some one must be appointed to measure and record the flow and to adjust from day to day the headgates of the canals diverting from the stream. Such an appointee, with proper authority, has been found to be the most effective agency by which the owner of a vested right may be relieved of constant vigilance to secure his water. There have been few appointed in California, but in other states practically all streams are thus regulated. Experience in this and in other states is discussed in Chapter IV.

Progress During Biennial Period.

Speaking generally, the office has made material progress in all its more important functions during the two years just passed. At the beginning of this time the State Water Commission was many months behind in its work, due to the great and sudden increase in all lines of water resource development which came about following the close of the World War and the resumption of business activity in 1919. This rush of work found the Commission unprepared, both as to funds and personnel. Neither defect could be remedied on short notice, as additional funds were not available, and due to the legal and technical complexities of all activities under California water law, very specialized experience is necessary in the engineering personnel. The organization has been built up to meet the situation as rapidly as possible, and more adequate funds became available at the beginning of the present biennium on July 1, 1921. At the present time, the Division is approaching the condition of being able to function rapidly and efficiently on the work coming before it, which will be a most gratifying change from the status obtaining since early in 1919. This statement can not be closed without grateful acknowledgment to the unfailingly loyal and hard-working employees of the Division who have made this result possible.

Applications to Appropriate Water.

In Table 1, page 12, is shown in comparative form a summary of applications received and permits issued during each biennial period since the act was passed. Also, on Plate 2, page 11, is shown graphically the number of applications as compared to size. It will be seen that there is a constant increase in both size and number of applications. This increase can not, of course, continue and there is some indication from the graph that the number of applications per year will not further increase. It would seem reasonable to expect that the size of development proposed in each application for irrigation use would continue to increase, for the smaller projects have presumably been well taken up, and future developments must necessarily be in larger units. This increased complexity has been reflected already in the increased investigative work done by the Division.

The succeeding chapter contains a series of graphs depicting the activity in various phases of such work since the establishment of the

TOTAL APPLICATIONS RECEIVED

HORSEPOWER PER APPLICATION

ACRES PER APPLICATION

office, one of which shows the number of unacted upon or pending applications to appropriate water for each quarterly period. Since January, 1922, and for the first time in the history of the office, this number has not increased, showing that applications have been disposed of, by permit action or cancellation, at a rate equal to their receipt. The issuance of larger numbers of permits will cause a constant increase in field investigations and inspections, however, as the permits are kept under close supervision in order that there may be no lapse in that record of development which is necessary to finally vest these rights.

Chapter II is devoted to a discussion of the functions and activities of the Division in the supervision of the acquisition of new water rights, and reference to this chapter is made for more detailed information on this subject.

TABLE No. 1.

Numerical Summary by Biennial Periods of Applications Received and Permits and Licenses Issued.

	Totals to Dec. 1, 1916	Dec. 1, 1916 to Sept. 1, 1918	Sept. 1, 1918 to Sept. 1, 1920	Sept. 1, 1920 to Sept. 1, 1922	Totals

Summary by Counties.

In Tables 2-A and 2-B, appearing on pages 16 and 17, at the end of this chapter, will be found summaries of the present and proposed irrigation and power development in California, separated by counties. The summary of existing development is not from the records of the Division, but is of interest by way of comparison. These tables give the number of applications received, the number of permits issued, the acreages planned to be irrigated and horsepower planned to be developed both for permits and pending applications. While the figures appear excessive, and do contain some duplications which could not be eliminated, they still represent actually proposed development, some of which will be put through.

Adjudications and Court References.

The accomplishments of the Division in the determination of rights by adjudication or by court reference proceedings during the biennium

are fully set forth in Chapter III. This important part of the work has increased considerably; however, in view of the great value to vested rights in receiving a clear and easily defended definition of such rights, it is the belief of the Division that this phase of its service is yet in its infancy.

Administration.

The legislature in 1921 amended the Water Commission Act to provide for effective state administration of the distribution of water in accordance with rights which had been adjudicated. Activity under this amendment is recited in Chapter IV.

Special Investigations.

In Chapter V is given a résumé of a number of water resource investigations which are being carried on under the direction of the Division. One of the more important of these, that on Kings River, has already been commented upon. Another, on the San Joaquin River, equally important in the development of the state, is treated fully in Chapter VIII.

These investigations, while desired by the Division in connection with action upon applications, have required field work and studies too expensive for the office to undertake, and the applicants, or interested parties, have advanced part or all of the funds with which to prosecute the work.

During the past year the Division has supervised the expenditure of approximately \$35,000 in this class of work and has contributed directly from state funds somewhat less than \$4000.

A considerable demand exists for the direction by a disinterested agency of such investigations in various parts of the state. The determination of obscure physical facts must be made by experienced and competent engineers; also, the results to be of full value and acceptable to all local interests must be entirely impartial. Particularly is this true of underground water investigations. The Division of Water Rights, as an impartial fact finding body with specialized experience along these lines, is singularly well fitted to render this assistance, and it is believed that this is a proper field for state cooperation and participation: first, because of the areas, people and investments involved, and secondly, because it is felt that state encouragement should be given to further development of its natural resources.

Cooperation with United States Departments.

The Division maintains close and effective cooperation with the United States Forest Service, Geological Survey, and Power Commission. This cooperation is not only mutually advantageous, but on account of the relation of the National Government to the state, the one controlling all lands unpatented, the other all water unused, is necessary for proper operation of the offices concerned, and to be able to give the service to which the public is entitled. For instance, if the Division of Water Rights and the Power Commission did not function in unison, power projects in this state might be held up for years or be defeated altogether. The Forest Service is of particular assistance to the Division in inspecting small outlying diversions, very difficult

and expensive to get at otherwise. The water resources branch of the Geological Survey collects stream flow records throughout the state, which records, in view of the already large use of water, are necessary before any project, irrigation or power, can proceed intelligently, and which are therefore vital to the development of the state. The Division of Water Rights contributes financially to the collection of these records. A full description of all activities in connection with the federal departments is given in Chapter VI.

Record of Old Rights.

During its eight years of existence the office has received in connection with applications and protests and in other ways a large amount of data relative to vested water rights established prior to that time. These data are filed in the office of the Division as public records, and there is a considerable use made of them by the public. There is also a demand for such records not on file with the Division, as it is naturally supposed that the office has a complete record of established water rights. The Division believes that ultimately such a record should be in the office, both for its own use and for that of the public, and is gradually assembling in available form such data as is received.

Economy of Placing Rights on Record.

The value to the owner of an old water right of having a record of the same on file in the Division office is brought out elsewhere in this report. However, it is noted that it is especially valuable to the large company or holder of many rights, as in addition to the protection feature, the expense and annoyance of protest correspondence, etc., is reduced.

Bureau of Information.

The Division acts in the nature of a bureau of information in answering questions regarding water right principles. In this, it has been of much service in settling difficulties, in clearing up a number of intricate water tangles, and in bringing together those who desired an equitable settlement of their difficulties, but were in doubt as how best to proceed. It is believed that much useless and expensive litigation has been avoided through this service.

Tulare Decision.

In December, 1921, the Supreme Court of California handed down a decision in the so-called "Tulare Case." An action had been initiated in 1919 by the Tulare Water Company, a subsidiary of Miller and Lux, to compel the Water Commission to issue a permit on its application for water from Buena Vista Slough, the Commission having denied the application. The Commission had then entered a demurrer to the prayer for writ of mandate and the case on demurrer had been taken to the Supreme Court.

Probably no California decision in recent years has received more local publicity and certainly no decision has been more universally misunderstood. Primarily on this account a full statement of this case has been made in Chapter IX by Mr. Spencer E. Burroughs, attorney for the Division, in connection with a description of the work of the legal department.

Riparian Rights.

The familiar subject of riparian rights can not be passed without mention. This is written merely to emphasize the fact that the problem of unused riparian rights has not been solved, but is still with us, and to point out that a vast number of such unused rights are in existence. Since 1911 no less than seven investigative or regulative state boards or commissions have been formed by the legislature (including the Division of Water Rights) to promote the development of the state's water resources, and all have encountered the bar of the riparian problem immediately. A great deal of thought has been given the subject by these boards and their recommendations vary from condemnation to laws designed "to lessen the riparian right evil."

The attitude of the state was crystallized in a law set forth in section 11 of the Water Commission Act, which provides that riparian rights not exercised within ten years after the passage of the act (Dec. 19, 1914,) shall be forfeited. If this law proves an equitable method of dealing with the matter, the great problem will be practically solved, and a serious bar to California's progress removed.

Los Angeles Office.

There has been a growing demand during the period of increasing activity in water development since the close of the war, that the Division maintain a serviceable branch office at Los Angeles. Of the total of 3003 applications to appropriate water received, 1049 are in the ten southern counties which would be tributary to a Los Angeles office. The Division feels that in all fairness to the southern part of the state, such an office should be established.

Underground Water Problems.

Southern California has also within recent years developed a series of physical and legal problems in connection with the use of underground waters which are not covered by either court or statute law, and which are becoming of a serious nature. This situation is discussed in Chapter X and recommendations for legislation to clarify the situation are advanced.

Minor Amendments to Water Law.

The Water Commission Act as enacted in 1914 has been successively amended by the legislature in the 1917, 1919 and 1921 sessions. With the advances being made in the character of development work, new problems continually arise not contemplated by the original act, and amendments, usually of a minor nature, become necessary. A number of such minor corrections and amendments, the need for which has developed, will be submitted to the next legislative session.

RECOMMENDATIONS.

In closing this chapter, the Division of Water Rights advances the following recommendations relative to legislation:

First: Amendment to the Water Commission Act providing limited jurisdiction over underground water, and making certain definitions with regard to the same.

Second: Minor amendments in connection with the act for which need has developed.

Third: Appropriation of sufficient funds to allow the Division to fulfil its proper place in the development of the state water resources.

TABLE 2-A.

Summary by Counties of Development as Proposed in Applications Received.

County	Applica- cations received	Projects under permit or license			Applications pending		
		Number	Acres	Theo. H. P.	Number	Acres	Theo. H. P.

CHAPTER II.

SUPERVISION OF ACQUISITION OF NEW RIGHTS.

The Water Commission Act provides for state supervision over all water rights initiated after the date the act went into effect, or December 19, 1914, and in a measure also provides for supervision over rights of appropriation initiated prior to, but not yet perfected at that time.

This is in contrast to the conditions which prevailed previously when there was in California no state supervision over the acquisition of new rights to the use of water. Appropriative rights could then be acquired either under the provisions of section 1415 of the Civil Code by posting a notice of appropriation at the proposed point of diversion, recording a copy of such notice in the office of the county recorder and proceeding with "due diligence" to construct the necessary works and to apply the water to beneficial use,—in which case priority ran from the date of posting the notice,—or a water right might be acquired by merely constructing the necessary works and applying the water to beneficial use, in which case priority ran from the date on which the water was actually beneficially used.

There was during this time no attempt to define the project for which the appropriation was made. The amount claimed was generally out of all proportion to what would be required under conditions of reasonable use. There was no means to work out the relation of the new appropriation to vested rights or future appropriations except by tedious and expensive litigation. There was no definite requirement in the way of diligence. And there was no adequate means of eliminating the "dead timber" of rights once initiated but forfeited through non-use.

An analysis of the nature of the supervision over the acquisition of new water rights provided for in the Water Commission Act, and now exercised by the Division of Water Rights, follows. There is also included a statement of the office and field procedure by which this supervision is carried on and some statistical summaries and diagrams showing the activities of the Division.

Character of Supervision.

The principal service performed at present by the office of the Division of Water Rights is in connection with the initiation of new rights through applications filed to appropriate water under the provisions of section 11 of the Water Commission Act. This service is performed by the functioning of the office in four ways:

The first, and perhaps most obvious of these functions, is the service which is performed in acting as a central recording office for all new water rights initiated within the state. The files of the Division of Water Rights now contain a complete list of all appropriative rights to the use of water initiated since the approval of the Water Commission Act, and reference to a single map shows at a glance not only the location of each diversion point but the status of the right, *i.e.*, whether only initiated, approved for permit, or construction completed and use confirmed by issuance of license.

This is a marked improvement over conditions obtaining previous to the approval of the act when it was a very difficult matter for one con-

templating a new appropriation to determine how the flow of the stream from which he proposed to divert might be affected by vested rights, and more especially by those recently initiated.

The second, and probably most important function at the present time in connection with applications filed under section 11 of the act, is the clear definition which is worked out for each right initiated.

Before the application is approved for permit, the applicant must make known upon his application form and the accompanying maps, the source of the proposed appropriation, the location of the point or points of diversion, the character and capacity of the proposed diversion works, the location and character of the proposed use and all other data necessary to adequately describe his project.

The third function in connection with applications under section 11, is the service which is performed for the applicant and for owners of vested rights in working out the probable extent of interference of the proposed diversion with diversions under vested rights.

This service is performed by first giving proper publicity to the proposed appropriation, then hearing and investigating protests filed, and lastly, if in order, approving the application for permit with such limiting clauses "as in the judgment of the Commission will best develop, conserve, and utilize in the public interest the water sought to be appropriated."

Under conditions prevailing prior to the passage of the Water Commission Act, there were no adequate means by which a new appropriator might determine the nature and extent of opposition by vested rights.

The Division now endeavors to advise all parties who may be interested in a new appropriation and proceeds to make clear the relation which the proposed new appropriation will have to diversions under vested rights. This relationship is brought out by correspondence, by conference, and by investigations both in the field and office. All interested parties are requested to furnish any data which are pertinent. If there is no unappropriated water the fact is clearly presented to the applicant. If there is unappropriated water, available to the applicant, without interference with use under vested rights, that fact also becomes clear. In such case, without resort to litigation, the conditions are defined under which this unappropriated water may be diverted by the applicant.

Owners of vested rights should recognize that a well sustained protest wherein the nature and extent of the rights involved are clearly defined accomplishes for a protestant much the same result by reason of this definition, as an application filed by a new appropriator, in that it tends to establish the relation of the one right to others, both old and new, upon the same stream, and this at a time prior to the commencement of construction in connection with the new appropriation.

The fourth valuable function performed by the Division in connection with applications filed under section 11 is the clearing away of "dead timber." This is brought about by weeding out impractical, visionary, and speculative projects and by promptly scaling down to reasonable amounts the quantities applied for.

The completion of an application with proper accompanying maps, the clearing away of protests and definite statement of plan, works no hardship upon the bona fide project. Every step required by the

Division is one which the promoter of a project must in any event take in its orderly development. But the surveys, the preparation of maps, and the response to protestants does throw a burden upon the visionary, impractical and purely speculative projects which prevents them from standing indefinitely in the way of live projects.

At the earliest practical moment after receipt of an application the quantity of water applied for is scaled down to an amount consistent with the beneficial use in the project contemplated. Permits are refused for water in excess of such an amount, the period for construction is defined and time limit set for the initiation and completion of beneficial use.

With the wide seasonal variation of California streams there may be unappropriated water during one portion of the year and not at another. By inserting in the permit the approximate period of the year when there may be unappropriated water, and denying the application for the remainder of the year, one common cause of controversy, the attempted diversions by later priorities when the stream flow is low, is eliminated.

Annual progress reports are required from permittees and if construction and use is not completed within reasonable time the permit is either revoked or a license issued for the amount of water actually applied to beneficial use only.

Aside from the initiation of new rights of appropriation under section 11 of the Water Commission Act, the Division of Water Rights has various other functions in connection with the acquisition of other new rights. These are (1) the authority, under section 11 of the act, to declare that a group of diversions benefiting from a common storage development may be designated as one project and so considered; (2) the authority under section 12 of the act to prescribe conditions under which an applicant may join in the occupancy and use of existing works for the diversion of water or may enlarge existing works and thereafter share in the occupancy and use thereof; (3) the authority under section 12 of the act to prescribe for a particular project the time within which the full amount of water appropriated prior to the passage of the Water Commission Act shall be applied to a useful or beneficial purpose, providing reasonable diligence has been shown; and (4) the authority under section 16 of the act to consider and accept or reject, petitions of permittees and licensees to change points of diversion and use.

In numerous instances the Division has declared related reservoir projects a unit and established a construction program prescribing definite dates for completion of the various parts thereof, allowing a large project to have its priority maintained and protected during development, providing reasonable diligence is shown.

There has as yet been no request for the office to function in the matter of prescribing the conditions under which applicants may enlarge and share in the occupancy and use of existing works.

There have been filed altogether twenty-two petitions under section 12 of the act requesting that the Division issue a certificate prescribing the time within which the full amount of water appropriated according to the law prior to the passage of the Water Commission Act shall be applied to a useful or beneficial purpose.

The authority under section 16 of the act to consider and accept or reject petitions to change points of diversion and places of use under rights initiated by application to the office is one often invoked and is of considerable importance. Such changes are allowed provided no injury will result therefrom to vested rights. Prior to the passage of the act there was no prescribed way of bringing about such changes nor is there now any method provided by law for making such changes in rights other than those initiated by application to the Division.

The office also endeavors to maintain upon its records the chain of title to all rights initiated through its functioning and has adopted the practice of requiring all assignees of applications to file proper evidence of transfer.

To summarize, it may be said the character of supervision exercised by the Division of Water Rights over the acquisition of new appropriative rights is such as to define and maintain a public record of all rights initiated, establish the relation of rights so initiated to vested rights, and clear away the "dead timber" of rights initiated and forfeited through failure to complete or through non-use.

Office Procedure in Connection with Supervision.

The office procedure under which the above described supervision is carried on is the result of approximately eight years of development and has become well established.

When an application is received there are four simple requirements which must be satisfied before the application will be accepted and a priority established. The application must be accompanied by the five dollar filing fee required by law, it must give the source of the proposed appropriation, name an amount, and locate, at least approximately, the proposed point of diversion. When the new application is satisfactory in these four requirements it receives a number and is at once referred for examination as to remaining details and inspection of maps.

It is an unusual occurrence for an application to be received which is complete and accompanied by satisfactory maps. And although the requirements in this respect would appear fairly simple and void of all unnecessary intricacies, still it may be said that a very considerable portion of the work of the office is expended in an effort to obtain from applicants a clear and consistent definition of their intention and purpose in connection with projects described in the applications. The value of this effort has been explained heretofore. It is of sufficient importance to repeat that there is at the present time no more important function of the Division than that of working out a clear definition of all new appropriative rights to the use of water initiated in the state.

When an application has been completed in all details, and the necessary maps have been filed, steps are taken to give proper publicity. All other applicants before the Division on the same stream, all protestants to these previous applications, and all other individuals and corporations, of which the office, through its various channels of information, has been advised as being interested, are sent notices giving the essential data of the application. Copies are also sent to local postmasters for posting in a conspicuous place.

If the proposed diversion is for more than three cubic feet per second or two hundred acre-feet per annum, the notice is also published in a newspaper of general circulation within the stream system.

Protests are invited by this publicity and the protestant is required to serve a copy on the applicant. The applicant is required to reply thereto, also serving a copy on the protestant. After all protests and answers are in, and after all other data are gathered an analysis of the project is made. If the matter is not yet clear a field investigation is required. An effort is made to establish clearly to the applicant and also to the protestant the relation of the proposed new project to the claimants of vested rights or prior appropriative rights not yet vested. Ultimately, the Division is able to take final action with the reasons therefor clear to all. This final action may be the issuance of permit on the application as filed, or the issuance of permit on a modified application, or cancellation.

In connection with the publicity and protest procedure as described, in some instances companies or concerns having extensive or complicated vested water rights have filed with the Division a complete statement of their claims. As heretofore pointed out, the state, the protestant and applicant are all gainers by a valid protest, because it places on record, in a central clearing house, information which should be public. On practically all streams there are applicants before the Division and will be more, and so a statement of all claims on all streams relieves the large concern of the necessity for reiteration of protests in connection with each new application.

After the issuance of a permit there is little office activity in connection with the supervision of the initiation of new rights under section 11 of the act. Permittees may request extensions for completion of construction and use, they may request that there be entered upon the record assignments of the rights initiated or they may petition changes in the points of diversion and use, which latter matters are handled much in the same manner as the receipt of a new application in that the proposed changes must be clearly defined, proper publicity must be given, and protests must be received and considered. Eventually, as a result of the reports by permittee or of field inspections made by the field engineers of the Division each permit is either revoked or a license is issued thereon, certifying that as a result of construction and beneficial use under the terms of the permit the permittee is entitled to a right to the use of a certain amount of water under a priority of the date of his original application.

Applications filed under section 12 of the Water Commission Act requesting that the Division consider the matter of diligence shown in connection with the completion of appropriations begun prior to the passage of the act have been few in number and are handled in almost identically the same manner as applications filed under section 11 as heretofore described.

The remaining functions of the office in connection with supervision over the acquisition of other new rights comprise also a relatively small part of the work performed in the office and the procedure connected therewith is, therefore, passed without further discussion than that heretofore given in this chapter.

FIELD INVESTIGATIONS.

The field work carried on by the Division of Water Rights in connection with the supervision of the acquisition of new rights is divided into three classes: first, the investigation of applications and protests

thereto, prior to action relative to issuance or denial of permit; second, the inspection of construction work and use of water under permits issued; and, third, the investigation of miscellaneous matters pertaining indirectly to applications and permits.

About one-third of the applications received by the office are protested, and about one application out of every eight received requires an investigation in the field by an engineer.

Protests vary in nature and kind from those which are merely intended to place certain existing rights on record in connection with the proposed application, to those which require a very careful study of water supply, existing rights and other conditions, and involve conferences and hearings as well.

The field work in connection with a protested application may consist of merely a visit to the site of the controversy and an interview with interested parties, it may include a series of stream or ditch measurements extending over a period of from a few days to several years, together with studies of use under existing rights, or it may include the planning and supervising of an extensive study of water supply, including both surface and underground water. It is often advisable to hold conferences or hearings in the locality in question, in order to bring out all information possible bearing on the subject, and if necessary to effect a modification of the application, or an agreement between parties, in order that future controversy will be eliminated.

The Water Commission Act provides that the office shall cause an inspection to be made of the project under a permit after the date when the same has been completed in accordance with the law, terms of the permit, etc. Based upon the use as found by this inspection, a license is issued, or an extension of time is granted to complete use, if it appears that reasonable diligence has been shown. If such diligence has not been shown, the permit is revoked.

The construction work on larger projects is inspected from time to time for the purpose of obtaining a record of diligence in construction. In case it has been found that no work has been done, the permit is revoked and the applicant may make a new filing with a later priority if he so desires. This is a direct service to all later appropriators, inasmuch as it does not allow holders of permits under early priorities to maintain them without making a reasonable effort to utilize the water.

Where use of water has not been made, or is only partially completed by the date set, and it appears that with reasonable diligence the use should have been completed, the permit is revoked, or a license issued based upon the amount of water which has been put to beneficial use, and if the permittee desires to proceed with his development, a new priority is required to be established through a new filing.

Miscellaneous matters investigated in the field range from the collection of special hydrographic data pertaining to a particular time or locality, and necessary in connection with the work of the office, to assistance in general matters relating to water and within the jurisdiction of the Division. Some of these investigations are of sufficient importance that they are treated individually hereafter in Chapters V, VII and VIII. Power projects and the more complicated irrigation projects are requiring an increased amount of time, but the major portion of the field work is in connection with routine matters.

APPLICATIONS PENDING

TOTAL APPLICATIONS , AGRICULTURAL APPLICATIONS , POWER APPLICATIONS 

The field engineers, visiting every section of the state on these matters, become familiar with local conditions, and the knowledge they obtain is of great assistance in connection with matters which can not be clarified by the office through correspondence.

Due to the large number of cases which must be visited each year in the field, careful planning of the season's field work is necessary, in order that traveling expense and time can be kept at a minimum. This method of grouping cases to be visited according to locality and trip often causes delay in acting upon matters awaiting field investigation, but with the number of engineers available for the work at present, it is the only manner in which the work can be handled and the ground covered.

There are four engineers who devote the major part of their time to routine field inspections and investigations and reports thereon. During the biennium there were 1334 cases requiring field investigation, but of these it was possible with the force available to visit only 984. Due to greater familiarity with the state and with local conditions, there is an increasing efficiency in handling this work.

There is a considerable lag between the time an application is received and the time when field work becomes necessary upon it. Many applications require two or three visits in one year, and visits extending over several years before they are settled. Most permits require more than one visit before license is issued, due to extension of time allowed. The increase in field work required in 1922 over 1921 reflects the increase in number of applications received during 1920 and 1921 over preceding years. During the next year or two this work will probably at least stay constant, if not increase in amount. An increased number of permits due for inspection can be expected during the succeeding years, as they do not usually require inspection for from two to four years after the applications are received. Of those considered for inspection during 1922, only 5 per cent were upon applications received during 1921, 24 per cent upon applications received during 1920, and the remaining 71 per cent for applications received prior to 1920. The permit inspections resulting from the large increase in applications received commencing in 1919 and 1920 will occur during the next two years.

STATISTICAL SUMMARIES AND DIAGRAMS.

The activities of the Division in connection with applications filed under section 11 of the Water Commission Act are shown graphically in the accompanying diagrams. These deal altogether in cumulative totals at the end of quarterly periods, and cover the entire time since the office began to function.

Plate 3 shows in one part the action taken upon applications. It presents graphically in cumulative form by quarterly periods the total number of applications received, the number granted, the number cancelled or withdrawn, and the number pending. Plate 3 in the other part shows in cumulative form the total power applications, and agricultural applications on which action was pending at the end of each quarterly period.

Plate 4 shows, cumulatively, the total acreage to be served and total horsepower to be developed by all applications filed up to the end of each quarterly period.

GRAPHICAL SUMMARY OF APPLICATIONS AND STATUS THEREOF ACREAGE APPLIED FOR

TOTAL PENDING  - TOTAL CANCELLED  - TOTAL GRANTED 

THEORETICAL HORSEPOWER APPLIED FOR

TOTAL PENDING  - TOTAL CANCELLED  - TOTAL GRANTED 

Plate 5 shows, cumulatively, the total second-feet for direct diversion and total acre-feet for storage included in all applications filed up to the end of each quarterly period.

The trend of the lines showing these cumulative totals is significant in many respects.

In Plate 3 the line showing applications received presents a decided break about the first of the year 1919. Prior to this date applications were received at an average rate of twenty-three per month. Since that date applications have been received at an average rate of forty-two per month. This increase in rate is to be accounted for no doubt in large part by the close of the World War. The passage of the Federal Water Power Act also had an effect, as will be pointed out in more detail later.

Not only have the applications been received in increased numbers during the past four years, but they have also represented larger projects. In this connection reference is again made to Plate 2 on page 11. The acreage to be benefited by the agricultural applications filed has averaged 42 per cent greater during the past four years than during the preceding four years, and the theoretical horsepower to be generated under applications for power purposes has averaged 129 per cent greater.

This combined increase, both in the number of applications received and in the magnitude of the projects contemplated in the applications, explains at least in part the rapid upward trend, after January 1, 1919, of the graph of applications pending. Applications for large amounts are generally more complex and require much more consideration. The number of applications awaiting action was therefore increasing because of the inability of the office to dispose of applications at a rate equivalent to that at which they were received.

There is a break, about April 1, 1922, in the line showing applications pending and it takes a downward trend, but a line showing permits pending if such a plat were drawn would at the same time take a sharp upward trend. The major portion of field work in connection with an application takes place after it is granted. Therefore, a marked increase in the field work may be expected.

There is also food for thought in the fact that of the applications thus far acted upon a large proportion represent smaller projects, while of the applications with action yet pending there is a considerable proportion representing larger projects.

These graphs indicate several things. They convey some picture of the progress and development of the work of the Division of Water Rights. They suggest something of the service performed when an application is cancelled from the records and the filing ceases to be a deterrent to later applicants, but their greatest interest lies in their showing as to what may be in store for California in the near future.

The development of California's greatest natural resource passes first in review before the office of the Division of Water Rights and is epitomized on the graphs shown on plates three, four and five. Each acre which it is proposed to irrigate and each unit of water power which it is proposed to develop is to be irrigated or is to be developed by a plan which has crystallized in someone's mind to such a degree that it can be expressed by the statement of the plan which is a necessary part

GRAPHICAL SUMMARY OF APPLICATIONS AND STATUS THEREOF

SECOND FEET APPLIED FOR

TOTAL PENDING  TOTAL CANCELLED  TOTAL GRANTED 

ACRE FEET APPLIED FOR

TOTAL PENDING  TOTAL CANCELLED  TOTAL GRANTED 

of an application before the Division. A very large proportion of the developments proposed are not feasible now and there is not water enough for all which have been proposed. Neither can capital be found available to finance at a rapid rate even those projects which are feasible now, nor are there settlers in sufficient numbers for the lands which it is proposed to irrigate, nor power users for the power development which it is proposed to build.

Nevertheless, the plans which have been made, and which are now on file, were made in response to a demand which now exists for an increased area of irrigated land and an increased power development, and whether the ratio of constructed projects as compared to filings is large or small has little bearing on the matter, for certainly some percentage of these projects will be constructed.

Probably the average lapse of time between filing for water and beginning construction on a large project is more than five years, hence they indicate that the state is now entering a period of development greatly surpassing its past. The greatest part of the future development of California must come about by a greater utilization of the waters of the state and the first step in the utilization of these waters is the filing before the Division of Water Rights, which filing must soon after be accompanied by a definite plan for the use of the water filed on. The graphs not only indicate that the state is now entering on a greatly accelerated period of development, but they show that as yet no slackening in this accelerated rate of progress is in sight.

CHAPTER III.

ADJUDICATIONS AND COURT REFERENCES.

The Water Commission Act, as amended in 1917 (sections 25 to 36*f*, inclusive), provides a complete procedure for the determination by the Division of Water Rights of all water rights by appropriation upon any stream, stream system, lake, or other body of water, such determination to be confirmed or modified by court decree. By virtue of the sections referred to, the Division of Water Rights may supplement with an effective and expeditious method the work of the courts in adjudicating water rights by appropriation.

The act also provides (section 24) that in case a suit is brought in the superior court involving the determination of water rights, the case may, in the discretion of the court, be transferred to the Division of Water Rights for investigation as referee. By this procedure, riparian rights, as well as rights by appropriation, may be determined.

Necessity for Determination of Water Rights.

Since December 19, 1914, the date on which the Water Commission Act went into effect, water rights by appropriation can be acquired only under the provisions of the act, in which case such rights are determined through the procedure provided in the act for supervision over the acquisition of rights by appropriation and described in Chapter II.

However, most of the present irrigated acreage in the state acquired its rights prior to that time and the loose methods of filing then existing and lack of supervision to determine whether all or any part of these rights have become vested by use has resulted in the existence of a vast number of rights undefined and in many cases even unrecorded.

One of the important functions of the Division of Water Rights is to protect the vested water rights on any stream system by administering the distribution of water to the various diversion systems entitled to its use, under the provisions of the Water Commission Act as amended in 1921 (sections 37 to 37*e*, inclusive). Before such administration can be undertaken, however, it is necessary that all water rights from the stream system shall have been determined.

Procedure.

Proceedings for the determination of all water rights by appropriation from any stream system, may be undertaken by the Division of Water Rights, either upon its own initiative or upon the receipt of a petition signed by one or more claimants to the use of water from such source. The procedure provided in the Water Commission Act closely resembles that which has been successfully practiced in Oregon and Nevada for some years, the constitutionality of which has been upheld by decisions of courts in those states and also of the Supreme Court of the United States. (In *re Willow Creek*, 74 Or. 592, 144 P. 505, 146 P. 475; *Vineyard Land and Stock Company vs. District Court of Fourth Judicial District of Nevada in and for Elko County et al.*; 171 P. 166; *Pacific Livestock Company vs. Lewis*, 36 Sup. Ct. 637 (Reporter System)).

Adjudication proceedings under sections 25 to 36f, inclusive, of the act are initiated by the filing of a petition signed by one or more claimants or by action of the Division on its own initiative. An order is entered by the Division designating the stream system to be investigated; notice is published; a thorough investigation and compilation of data is made by Division engineers; notice is published setting a date on or before which proofs must be filed by claimants; forms for proofs are supplied by the Division; claimants are assisted in making their proofs; the proofs are assembled and submitted to public inspection; claimants are given opportunity to contest any proof or proofs; contests are conducted at a hearing; an order of determination is entered; opportunity is given dissatisfied claimants to show good cause and thereby secure a reopening of proceedings; the order of determination as first entered or as modified on rehearing is printed and a certified copy is filed with the clerk of the Superior Court in the jurisdiction wherein the investigation is made; an order from the court setting a date for hearing is obtained; notice of such hearing is published and served by registered mail; any time at least ten days prior to date of hearing parties aggrieved may file a notice of exceptions to the order and thereby secure a hearing in court and a determination made by the court. In case no exceptions are filed the court enters the order of determination filed by the Division, as its decree.

In the determination of rights under court reference (section 24 of the act) the Division of Water Rights follows the procedure provided in sections 25 to 36f of the act, as closely as the same may be applicable to the conditions. In such cases, however, it is not bound to follow any formal procedure, and any unnecessary steps may be eliminated which will accomplish a saving of time and money to the litigants.

Merits of Procedure.

The legal questions in connection with water litigation are complex but their solution is rendered more easy if they can be approached freed from the confusion entailed through conflicting evidence as to fact. The facts as to water supply, area irrigated and irrigable under any individual ditch, capacity of ditch and other related matters can be more accurately determined in the field than elsewhere. Testimony can be more accurately sifted in the light of such knowledge and with the help of the personal familiarity gained during the time such data are being secured. Furthermore, isolated court actions can not always sufficiently consider all matters which might have a bearing on the situation.

The provision of the Water Commission Act regarding adjudication of vested rights places on the Division of Water Rights the task of securing this physical data and taking testimony as to facts not determinable by a survey, leaving the legal questions to be determined by the court in regular court procedure. By this method all rights on the stream are brought into the proceedings and all matters having weight in the decision are presented at one time.

The merits of such a procedure are manifest but it is believed pertinent to emphasize the following points:

First, adjudication proceedings may be initiated in advance of actual conflict between water users and, by settlement of rights involved, actual injury to the holders of vested rights due to diversions by junior upstream appropriators may be averted. Trouble may thus be anticipated and forestalled, the continuance of amicable and neighborly relationships promoted, and strife and litigation reduced to a minimum.

Second, all rights by appropriation may be determined by adjudication proceedings and all rights whether appropriative or riparian may be determined by proceedings under court reference. A comprehensive determination results in either case and a single procedure thus determines rights which undetermined might be the basis for numerous individual suits.

Third, the resulting determination is based upon data collected by specially trained engineers, who are state employees and disinterested parties.

Fourth, a complete and thorough investigation and survey of the entire stream system is made, including an extensive series of stream flow measurements which is, when necessary, extended over more than one run-off season.

Fifth, the physical facts of the case are established and presented in the form of maps, tables and reports, and most of the historical facts are ascertained through the medium of written claims, all of which information is secured by a direct, simple, and effective procedure, at a reasonable cost and without unnecessary delay, and is presented in such form as to insure findings as nearly correct as human intelligence permits.

Adjudication Proceedings Undertaken.

The following adjudication proceedings under sections 25 to 36f of the Water Commission Act, have been undertaken by the Division of Water Rights or by its predecessor, the State Water Commission:

TABLE 3.
Summary of Adjudications.

Stream system	Location	Date of order initiating	Status Oct. 1, 1922	Remarks
Stanislaus River.	Alpine, Calaveras, Tuolumne, Stanislaus and San Joaquin Counties.	Aug. 24, 1917.	Pending.....	Order of determination entered by Division of Water Rights, Sept. 21, 1922.
West Fork Carson River.	Alpine County.....	June 23, 1919.	Completed....	Findings of State Water Commission confirmed by decree of Superior Court of Alpine County, entered November 29, 1921.
Oak Creek..	Inyo County.....	Sept. 26, 1921.	Pending.....	Collection of engineering data completed July 1, 1922.
Shasta River.	Siskiyou County.....	Dec. 21, 1921.	Pending.....	Collection of engineering data about 60% completed.

STANISLAUS RIVER.

The Stanislaus River stream system is an important tributary of the San Joaquin River from the east, and traverses the counties of Alpine,

Calaveras, Tuolumne, San Joaquin, and Stanislaus. The water rights involved include some of the oldest in the state, some dating back to the early fifties, when the waters were used for the famous placer workings of Columbia, Angels Camp and Sonora. In recent years, power development in the Sierras and the further development of irrigated areas in the valley have so drawn upon the resources of the river that their fullest utilization is now required.

Adjudication proceedings were undertaken upon receipt of a petition from the Oakdale and South San Joaquin Irrigation Districts, representing a total of 145,327 acres of land on the main floor of the San Joaquin Valley.

The engineering data were collected during 1917 and 1918. All proofs of appropriation were submitted, and an abstract of all claims filed was mailed to each of the claimants in 1919. A series of hearings on contested claims was held during the summer of 1920; all briefs and legal papers were filed by the various claimants and contestants early in the following year. An order of determination was entered by the State Water Commission on July 20, 1921, but on petition a rehearing was held in November, 1921. The final order of determination was entered by the Division of Water Rights on September 21, 1922.

The order of determination shows fifty-eight water rights, covering 1847.53 cubic feet per second direct diversion for agricultural purposes, 791.67 cubic feet per second direct diversion and 128,289 acre-feet per annum storage for power purposes, 209.20 cubic feet per second direct diversion for public service purposes, and 1.75 cubic feet per second direct diversion for mining purposes.

WEST FORK CARSON RIVER.

The West Fork of Carson River is an interstate stream, traversing Alpine County, California, and uniting with the East Fork of Carson River in Douglas County, Nevada. There are twenty-nine ditches diverting from the West Carson stream system within the State of California, supplying water for irrigation to about five thousand acres of land. In addition, there are approximately ten thousand acres of land within the State of Nevada which are irrigated with water diverted from the stream below the state line.

The Carson Valley was one of the earliest agricultural areas to be developed in the west. As the climate is arid, making irrigation necessary, the resources of the West Fork of Carson River were gradually drawn upon for the development of new land until, in about the year 1900, injury resulted to lower Nevada users due to extensive diversions above them. This condition led to a suit in the federal courts, with all of the Nevada users from the river as complainants and naming all of the California users from the river as defendants. On November 27, 1905, a decree was entered by the federal court, granting the Nevada users the exclusive right to the use of all of the waters of the West Fork of Carson River, whenever the same were required for irrigating their lands as they then existed, for the period of seven days out of every fourteen days, beginning on the first Monday of June of each year, and continuing to the end of October of each year.

Following this, the Nevada users had their water rights adjudicated under the Nevada law and the distribution of water in the seven day period during which they were entitled to its use was placed in the hands of a watermaster acting under the supervision of the State Engineer of Nevada. Under such administration, the distribution of water has apparently been handled to the satisfaction of all concerned.

In the meantime, new areas were put under irrigation in California, until in August, 1916, several of the lower California users complained to the State Water Commission that they were experiencing difficulty in obtaining the water to which they were entitled. Being familiar with the advantages which the Nevada users had obtained under the Nevada law, they desired to follow the same procedure. It was not until the Water Commission Act was amended in 1917, however, that this was possible, and a short time thereafter the adjudication was begun.

The engineering data were collected in 1920 and proofs of appropriation were submitted in that year followed by completion of the abstract of claims early in 1921. A hearing was held in June of that year and the order of determination was entered by the State Water Commission in July. The findings were confirmed by a decree of the Superior Court of Alpine County, entered on November 29, 1921.

The decree established thirty-nine water rights, covering 63.16 cubic feet per second direct diversion and 9637 acre-feet per annum storage, all for use for agricultural purposes.

OAK CREEK.

The Oak Creek stream system is the source of water supply for about two thousand acres of irrigated land in Owens Valley, situated immediately north of Independence, Inyo County. It originates in perennial snow banks near the summit of the Sierras and flows in an easterly direction to a point about two and one-half miles northwest of Independence, where the flow is distributed to four main ditches by means of a division box which was installed about the year 1872.

The use of water from Oak Creek dates from the establishment of Fort Independence, on July 4, 1862. The original fort covered an area one mile square, and a considerable portion of this area was cultivated and irrigated with water from Oak Creek by the soldiers who occupied the fort. In the later sixties, various settlers who located around the fort cleared considerable land and irrigated it with water from Oak Creek.

About 1870, the early settlers formed an association known as the "Oak Creek Water Users Association," in which the water rights of all members were recognized as of equal priority. Each member was allotted a certain number of shares in the association, in proportion to his irrigated acreage. The association constructed a division box on the stream which automatically distributes the flow to the four main ditches, in proportion to the number of shares owned by the members supplied by the respective ditches.

In recent years, subsequent appropriators have constructed ditches diverting water from the stream above the division box of the association. While these subsequent appropriators recognize the prior rights

of the association, contention has arisen over the amount of water to which the association is entitled.

Adjudication proceedings were undertaken upon receipt of a petition signed by all of the members of the Oak Creek Water Users Association, as well as by several of the subsequent appropriators.

The engineering data were collected during the period between May 20, 1922, and July 1, 1922, and proofs of appropriation will be called for in the near future.

SHASTA RIVER.

The Shasta River stream system is an important tributary of Klamath River from the south, and traverses Siskiyou County. As in the case of the Stanislaus River, the waters of Shasta River were used for mining purposes in pioneer days, and some of the water rights date back to the early fifties. Agriculture soon superseded the mining industry in importance in Shasta Valley, however, and the extent of the use of the waters of the stream system for irrigation has increased until there are at present over thirty thousand acres of irrigated land in the valley.

In July, 1921, several of the lower water users, possessing very old rights, complained to the Division of Water Rights of lack of water due to diversion by permittees of this office. An investigation was made by the Division followed by a conference with representatives of the Grenada Irrigation District, the latest appropriator on the stream, whose diversion was responsible for the complaint, and the directors of the district agreed to operate their pumping plant in such a manner as the Division should direct. An engineer of the Division was stationed in the valley for the remainder of the 1921 irrigation season, and the district's pumping plant was operated in such a manner as to allow ample water to pass down to the lower users, at the same time permitting the district to utilize such water as was available for it.

The supervision of the diversion of water from Shasta River during the period of shortage in 1921 demonstrated to the water users the advantages of state supervision of the distribution of water. Realizing that a complete adjudication of all of the water rights on the stream would be necessary as a basis for administration, twenty water users, representing over five thousand acres of irrigated land, submitted a petition requesting such proceedings. An order granting the petition and initiating the proceedings, was entered by the Division of Water Rights on December 21, 1921.

Collection of the field data was commenced on May 1, 1922, and is about sixty per cent completed at the time of this report.

COURT REFERENCES RECEIVED.

Suits involving the determination of water rights on the following stream systems have been referred by Superior Courts to the Division of Water Rights or to its predecessor, the State Water Commission, for investigation as referee, under the provisions of section 24 of the Water Commission Act:

TABLE 4.
Summary of Court References.

Stream system	Location	Date of order of reference	Status October 1, 1922	Remarks
Red Rock Creek.	Lassen County.....	May 27, 1916.	Closed.....	Case failed of completion because of involved land ownerships and other pending litigation.
Willow Creek.	Lassen County.....	June 12, 1916.	Completed....	Decree entered April 16, 1918.
San Pedro Creek.	San Mateo County.....	Sept. 6, 1917.	Completed....	Decree entered May 12, 1921.
North Fork Cottonwood Creek.	Shasta County.....	June 6, 1919.	Completed....	Decree entered June 9, 1920.
Hat Creek	Shasta County.....	March 29, 1920.	Pending.....	A stipulation has been drawn up which has been tentatively approved by all attorneys involved.
Burney Creek.	Shasta County.....	Nov. 25, 1921.	Pending.....	Collection of engineering data completed July 27, 1922.

RED ROCK CREEK.

The Red Rock Creek stream system rises in the Warner range in northeastern Lassen County and flows in a southerly direction onto Madeline plains. The flow is utilized for the irrigation of about thirty-two hundred acres of land.

The case of *McKissick Cattle Company vs. Union Land and Stock Company*, involving water rights on this stream system was referred to the State Water Commission for investigation as referee, by the Superior Court of Lassen County. An extensive field investigation of the water supply and use of water from the stream was made by the Commission, the results of which were submitted to the court. The case failed of completion, however, because of involved ownerships of land and other pending litigation.

WILLOW CREEK.

The Willow Creek stream system rises near Hayden Hill, in the northern part of Lassen County, and flows in a general northerly direction to its junction with Ash Creek in Big Valley. The flow is utilized by five ranches for the irrigation of about ten hundred and fifty acres of land.

The case of *Johnson et al. vs. Hill*, involving all water rights on the stream, was referred to the State Water Commission for investigation as referee, by the Superior Court of Lassen County. A hydrographic study of the stream system was made by the Commission covering the 1916 irrigating season, a report of which was made to the court. The case was tried by the court on July 2, 1917, the Commission's engineer attending the trial as a witness. Judgment was entered in favor of the plaintiffs, on April 16, 1918.

SAN PEDRO CREEK.

The San Pedro Creek stream system is located in San Mateo County, about twenty miles south of San Francisco. The flow is utilized for the irrigation of about four hundred and twenty-five acres of riparian land

intensively planted to artichokes and garden truck for the San Francisco market.

The case of *Tobin vs. Brown et al.*, an action brought by a lower riparian owner naming all other users from the stream as defendants, was referred to the State Water Commission for investigation as referee, by the Superior Court of San Mateo County. The Commission made a field investigation covering a period of two years, in which a thorough study of the water resources of the stream system was made, and the areas subject to economical irrigation, with their respective water requirements, were determined. Based upon the report of the Commission, a stipulation was prepared embodying a schedule for the distribution of the summer flow among the various claimants, which stipulation was signed by all parties to the action. A decree conforming with the stipulation was entered by the court on May 12, 1921.

NORTH FORK COTTONWOOD CREEK.

The North Fork of Cottonwood Creek stream system rises in Shasta County, about fifteen miles west of Redding, and flows in a southeasterly direction to its confluence with the main Cottonwood Creek, near Gas Point. The flow is utilized for the irrigation of about twenty-two hundred acres of land, including about sixteen hundred acres in the Happy Valley Irrigation District. The district plans to provide for the irrigation of an additional area of about sixteen thousand acres of land, by the construction of three storage reservoirs. The first of these, Misselback Reservoir, has recently been completed, providing capacity for the storage of fifty-seven hundred acre-feet of water per annum.

In the spring of 1919 a suit was brought in the Superior Court of Shasta County by the Bee Creek Ditch and Water Company, naming all of the other water users from the stream system as defendants, and appealing to the court to establish the relative rights of the various parties. The court then entered an order transferring the case to the State Water Commission for investigation as referee. The Commission made a field investigation of the water supply and use of water from the stream system covering the 1919 irrigation season. The various parties were able to agree as to the irrigated acreage under each ditch and consequently it was not necessary to make a survey of the irrigated land. Proofs of appropriation were filed by all parties to the suit, and an abstract of claims was mailed to each party. Practically all of the claims were contested.

A hearing on contested claims was set for April 12, 1920. Before proceeding with the formal hearing, however, the attorneys for the respective parties, aided by the representatives of the Commission, were able to arrive at an agreement for the allotment of the water. This agreement was signed by all parties to the suit, and in accordance therewith a decree was entered by the court on June 9, 1920.

The decree established thirteen water rights, covering 31.25 cubic feet per second for agricultural purposes, 2.00 cubic feet per second for mining purposes, and 0.90 cubic feet per second for power purposes.

HAT CREEK.

The Hat Creek stream system rises in the eastern part of Shasta County at the foot of Mount Lassen, and flows in a general northerly

direction to its confluence with Pit River, near Carbon. Near Cassel, Rising River enters from the east, supplying between three hundred and five hundred cubic feet per second to the flow at all seasons of the year. The Pacific Gas and Electric Company has recently constructed two power plants on Hat Creek below Rising River.

Above the influx of Rising River, the entire summer flow of Hat Creek is utilized for the irrigation of about twenty-five hundred acres of land. In recent years, lower users on this portion of the stream system have experienced difficulty in obtaining sufficient water, on account of increased use by land owners above them. This condition led to the suit of *Doyle et al. vs. Massie et al.*, in the Superior Court of Shasta County, which is an action brought by several of the lower users naming all other water users from Hat Creek above its confluence with Rising River as defendants.

The case was referred by the court to the State Water Commission for investigation as referee. A field investigation was made covering the 1920 and 1921 irrigation seasons, which investigation included a study of the water supply and duty of water, and also a complete plane table survey of all ditches and irrigated lands. Based upon the results of this investigation, a proposed stipulation has been drawn up by the Division of Water Rights, which stipulation has been tentatively approved by attorneys representing all parties to the suit. This stipulation will be submitted by the various attorneys to their respective clients in the near future, with recommendations that it be signed by all parties involved.

The proposed stipulation allots to each water user a definite quantity of water apportioned according to area irrigated, and further provides for a schedule of rotation to be operated between June 1st and October 19th of each year.

BURNEY CREEK.

The Burney Creek stream system rises on Mount Burney, in the eastern part of Shasta County, and flows in a general northerly direction to its confluence with Pit River, immediately below Burney Falls. The flow is utilized for the irrigation of about fifteen hundred acres of land in Burney Valley.

In 1916 a suit was brought in the Superior Court of Shasta County by Ednah M. Black, one of the lower water users, naming three upper users as defendants, and seeking to enjoin them from using water to her injury. Owing to the fact that the litigants were able to reach a temporary working agreement as to the use of water, the suit was not pressed until the fall of 1921, when it was referred by the court to the Division of Water Rights for investigation as referee. The Division made a preliminary field investigation, as the result of which a report was made to the court recommending that all other water users from the stream system be brought into the suit, in order that the findings would result in a complete adjudication of all water rights from the stream system. Acting upon this recommendation, the court ordered the plaintiff to file an amended complaint, naming eight additional water users as defendants.

A field investigation of the water supply and use of water from the stream system was made by the Division of Water Rights in July, 1922, a report on which is now in the course of preparation.

CHAPTER IV.

ADMINISTRATIVE DISTRIBUTION OF WATER.

Based upon experience in the seventeen western states in which irrigation is generally practiced, it has become recognized that a complete code of water laws must, in addition to providing a system for the supervision of the acquisition of new rights and a procedure for the adjudication of existing rights, provide the necessary administrative machinery under which water can be equitably distributed to the various diversion systems entitled to its use.

The importance of the administrative distribution of water is emphasized by the following quotation from "Elements of Western Water Law," by Mr. A. E. Chandler, former president of the State Water Commission of California:

"A little reflection will convince the reader that the goal sought in water right conflicts is the distribution of water among those entitled to its use. Litigation resulting in an adjudication of water rights is but the means to this end. Likewise, an orderly system for the proper record and control of the initiation of water rights is designed to fix the priority of the new rights so that the water may be distributed in accordance therewith without further adjudication or litigation."

Development of Law.

The first state to adopt an effective water code providing for the administrative distribution of water, was Colorado, in 1879. This code has been in effect, with minor changes, ever since its adoption, and has served as a model for legislative enactment in other states. Of the so-called "irrigation states," Kansas is now the only one which has not enacted legislation for the supervision of the distribution of water. A large portion of the state of Kansas is situated in the humid belt, however, and consequently the need for such legislation does not exist there to the same extent that it exists in the other western states.

In California, the principle of state supervision of the distribution of water was established when the Water Commission Act was passed in 1913. Section 37 of the original act empowered the Water Commission to supervise the distribution of water in accordance with the priorities established under the act, when such supervision would not contravene the authority vested in the judiciary of the state. The original act did not, however, specifically authorize the Commission to supervise the distribution of water to rights acquired before the act went into effect, or provide the necessary machinery for handling the distribution of water. It was not until the Water Commission Act was amended in 1921, that effective legislation providing for the administrative distribution of water was enacted.

Present Law in California.

At the 1921 session of the legislature, the "Water Master Bill" was passed as an amendment to the Water Commission Act (sections 37 to 37c, inclusive). This bill provides for the creation of "water districts"

by the Division of Water Rights, to include stream systems upon which all water rights have been determined. Upon written request from the owners of at least fifteen per cent of the diversion systems entitled to water in any water district, the Division may, if in its discretion necessity therefor exists, appoint one or more water masters for such district. Such water masters are authorized to divide the waters of the stream systems among the various conduits in accordance with their respective determined rights, and in the performance of such duty, may regulate diversion works and arrest anyone tampering with them after they have been so regulated. Changing or interfering with diversion works which have been regulated by a water master, constitutes a misdemeanor punishable by fine or imprisonment, or both. Any water user who is dissatisfied with a decision of a water master, however, has the right to appeal from such decision to the Superior Court of the county in which the regulation takes place.

Experience in California.

On some stream systems, early attempts were made to obtain regulation of the diversion of water through injunction proceedings. Such method necessitates numerous actions in court, however, involving great expense to the litigants. Furthermore, the results obtained are in most cases of but temporary value. The futility of attempting to accomplish satisfactory results by this method is now apparent.

Although there have been several streams in California where for many years the water users have, by mutual agreement, employed a *zanjero*, or water superintendent, to distribute water to the various ditches, the first instance of state supervision of the distribution of water occurred in 1919, when the Kings River Conservation Association appealed to the State Water Commission to appoint a water master to regulate headgate diversions from Kings River. The details of the operation of this and its ultimate result are described in Chapter VII.

The next instance of state supervision of the distribution of water occurred on the Sacramento River in 1920, which was described in the third biennial report of the Water Commission and which is briefly covered in Appendix II of this report.

The first and only water district which has been created under the provisions of the Water Commission Act as amended in 1921, is the West Carson Water District, in Alpine County. This district was created by an order of the Division of Water Rights entered on February 6, 1922, and embraces all territory included in the West Carson adjudication proceedings, which resulted in a decree entered by the Superior Court of Alpine County on November 29, 1921. On May 8, 1922, the Division of Water Rights received a petition signed by the owners of twenty-seven per cent of the ditches entitled to water in the district, requesting that a water master be appointed to supervise the distribution of water within the district. Early in August, the flow of the West Fork of Carson River reached such a stage as to necessitate the assuming of the duty of distribution of water by the Division of Water Rights. A water master was appointed, who administered the distribution of water within the district from August 7th to September 25th. No serious difficulties were encountered, and the situation was handled to the satisfaction of all parties involved.

Experience in Other States.

Naturally the value of the experience of other states in the administration of their laws on the adjudication of rights and distribution of water will be interesting to California only in so far as conditions in these other states are comparable to those in California and also in so far as the complexity of the problems encountered indicate what may be expected in California.

Wyoming, Colorado, Nevada and Oregon probably have the most perfect codes in regard to adjudication and also administration of water, while Idaho is to the forefront in its system of distribution as actually practiced. In the first two, adjudications take place at regular intervals and all new rights are placed in their relative priority by the date of their filing. The amount of the diversion attached to this priority is determined in the adjudication and is henceforth administered by the water master. In the latter two states, adjudications are made at the will of proper authorities.

Adjudications establish a water right in priority and in amount, but to be operative the adjudication must be succeeded by distribution of the water either by mutual agreement or in the hands of an organization with police powers to make effective the court rulings. Since in some of the other states the streams were adjudicated many years ago, there has grown up a system of state administration of streams which is effective in accomplishing the object which is sought in water right litigation and in water law; that is, to distribute the waters of the stream to those individuals who have acquired the right to its use.

In Colorado, Wyoming, Utah and Idaho, probably the greatest development of areas feasibly irrigated by gravity has taken place. As compared to California much greater reservoir capacity has been constructed, partially because the climate is arid and farming operations can not succeed without water as they can in large parts of the semi-arid or sub-humid sections of California, partly because an effective law exists, partly because pumping from ground water is not feasible as it is in so large an area in California. In other words, conditions in these other states force the water user to secure his late water supply through the construction of surface reservoirs rather than by pumping from underground reservoirs.

As shown by the activity before this office in filings made for the purpose of building reservoirs, California is on the eve of an era of reservoir development to secure a gravity late water supply and it is thought that a short description of the more interesting developments of administrative distribution in other states on streams where reservoir development is large will be of interest because California must soon encounter and solve similar problems of distribution. The agency which proposes to build a reservoir must be assured, before proceeding, that its stored water will reach the land for which it was built.

It is not always necessary to appoint a water master to regulate the diversions from a stream. In small communities all irrigated from one stream and where each man is acquainted with his neighbor the division of the water is often accomplished by mutual agreement. In larger stream systems where the users are widely separated the tendency of each water user is to divert at all times the water he needs although

some other has a right to its use. It was this condition that first made a water master necessary.

The duties of the first water master were primitive in the extreme. He was appointed by the state on a per diem basis. He was generally a farmer living in the vicinity. When complaint came from the owner of senior right that he was not getting the water belonging to that right, the water master merely went out on the stream and closed down the headgates of enough of the junior rights above the complaining right to insure that the requisite flow would reach the complainant. The water master perhaps took such action not more than half a dozen times each year and then only when complaint was lodged. He made no effort to anticipate complaints, nor did he spend time in study of the varying phases of the stream.

Such a system is still in effect on the smaller and more isolated streams of these states, even when on other streams a more complicated administration is necessary. It answers the requirements fairly well at a minimum expense only because the general community has a fair knowledge of conditions.

It was when water users became widely distributed in a stream basin that need for more highly organized administration was felt, and particularly after the first reservoirs were built it became necessary to summon men of great technical knowledge and high administrative talent to the work. Although there is not in the entire west any area of land with the extent and fertility of the Great Valley of California, which at the same time has water available and easily diverted for irrigation, yet there are extremely large areas of irrigated land watered from a single stream system having perhaps complex problems of distribution comparable to those which will be encountered in California.

Development on these stream systems would long ago have ceased had it not been possible to work out a fair and just method of distribution in the face of what would seem hopelessly complicated conditions. The best examples of efficient distribution of irrigation water are found in Colorado on the South Platte River and in Idaho on the Snake River.

South Platte River.

The waters of this stream are probably more intensively developed for irrigation than any other major stream in the United States. There are now 1,100,000 acres irrigated in Colorado from this stream and the area is continually increasing. To serve this there are now constructed 185 reservoirs averaging 5000 acre-feet in capacity and aggregating in excess of 900,000 acre-feet. A few of these reservoirs are in the headwaters on the streams but most of them are offstream and supplied by canals from the main stream and its tributaries. The developed area lies in a tract stretching about 300 miles along the river. Some of the reservoirs lie adjacent to the lands for which they were built, some many miles above and some many miles below. In operating these last the water goes to an area which has an old right while the agency building the reservoir diverts the natural flow which belongs to the old right. In one case an irrigation district constructed 19 reservoirs not one of which is above the lands of the district. Through the control exercised by the

water master the district secures the benefit by exchanging this stored water for natural flow which it diverts higher up.

It is at once apparent that such a system is a problem of very complicated operation. It is the outgrowth of over 40 years of experience in operation. It has not solved all the problems, being somewhat hampered by legislative restrictions, yet it is very efficient and satisfactory.

Snake River.

In Idaho a system which is on the whole more efficient has been worked out in the last ten years. The administrative unit has been made large enough to include all related diversions. The best example of this is on the Snake River on which the entire river and its tributaries have been placed under the control of one man who has in turn built up an efficient organization of subordinate technical men and water masters. The portion of the river from which diversions are made is about 300 miles long and from it and from tributaries there are irrigated about 1,250,000 acres with a possible extension of half as much again. The early appropriators were at the middle of the 300 mile stretch and there had been developed in this area about 400,000 acres served by about 40 different canals when development perhaps 100 miles below began. Here were built several ditches serving about 500,000 acres and these canals combined to build a reservoir of 800,000 acre-feet capacity in the extreme headwaters above the prior rights and supplemented this by another small reservoir below. Although the stream was administered by several water masters, each serving a part of the area in accordance with the usual custom, the people who had built the reservoir soon found that they were not getting their reservoir water but that the upper users now had a plentiful supply. This was because of divided control. With recognition of the fault the existing regulation was changed to enable it to cope with the situation. Some idea of the difficulties of administration is gained when it is realized that it takes 6 days for water to pass from the upper reservoir to the lower canals, that the natural discharge is continually changing and that the stored water must pass the headgates of 40 canals diverting a total of 12,000 second-feet. Nevertheless, the method of handling has solved these difficulties and is producing results satisfactory to all, so that development is going ahead rapidly. A 3,000,000 acre-foot reservoir will soon be built near the lower end by a group composing most of the water users on the river and the portion of its water belonging to the upper users will be exchanged for water in the upper reservoir and for natural flow. Other reservoirs are to be built on the tributaries and similar exchanges effected.

Aim of Water Master Control.

It is believed these instances serve to illustrate the essence of the desirability of adjudications and administrative distribution, that vested rights need be at no expense to protect their rights save for the nominal tax of the cost of distribution. This cost is almost negligible compared to individual court actions. At the same time under these safeguards unused waters may be appropriated and the upbuilding of the state go on to the benefit of all, unhampered by legal expense.

CHAPTER V.

SPECIAL INVESTIGATIONS.

Section 40 of the Water Commission Act is in part as follows:

“The State Water Commission is also authorized and empowered to investigate any natural situation available for reservoirs or reservoir systems for gathering and distributing flood or other waters not under beneficial use in any stream, stream system or lake or other body of water, and to ascertain the feasibility of such projects, including the supply of water that may thereby be made available, the extent and character of the areas that may be thereby irrigated, and make estimate of the cost of such project.”

The above gives the Division of Water Rights broad power to investigate any kind of an irrigation project. Many requests for such investigations have been received, but state funds for such work have never been available in large amount and most of the work so far undertaken has been financed by the interested parties. The work of the Division along these lines has proved particularly valuable in those cases where obscure matters relating to water and its use are under dispute.

There follows a short summary of the investigations which have been undertaken in the last biennium. The more important of these are treated more fully in succeeding sections of this report.

Kings River.

This work was commenced in December, 1917, as a special investigation to determine the diversions of existing water rights from Kings River, preparatory to the construction of Pine Flat Reservoir.

The work is still going on but has assumed larger proportions than was at first contemplated. It aided materially in defining the rights of the various ditch systems and has grown into the administrative distribution of the waters of Kings River in accordance with a schedule drawn up under the direction of the Division of Water Rights.

The importance of proper distribution of water is so great in its social and economic features, and the area watered from Kings River is so large, that Chapter VII of this report has been devoted to an interesting account of the work written by C. L. Kaupke, associate hydraulic engineer of the Division of Water Rights, who has been in charge at Fresno since the inception of the work. It was thought advisable in this article to review the history of the work up to the present time for it is believed that the close of the year 1922 marks the close of the period during which the investigative features were the most important and ushers in the time when administrative distribution of the water takes precedence.

San Jacinto River.

The San Jacinto River system lies in the western part of Riverside County, and is one of the important streams of southern California. It rises in the San Jacinto mountains, flows in a westerly direction, and at one time reached the Pacific Ocean, but at the present time the surplus

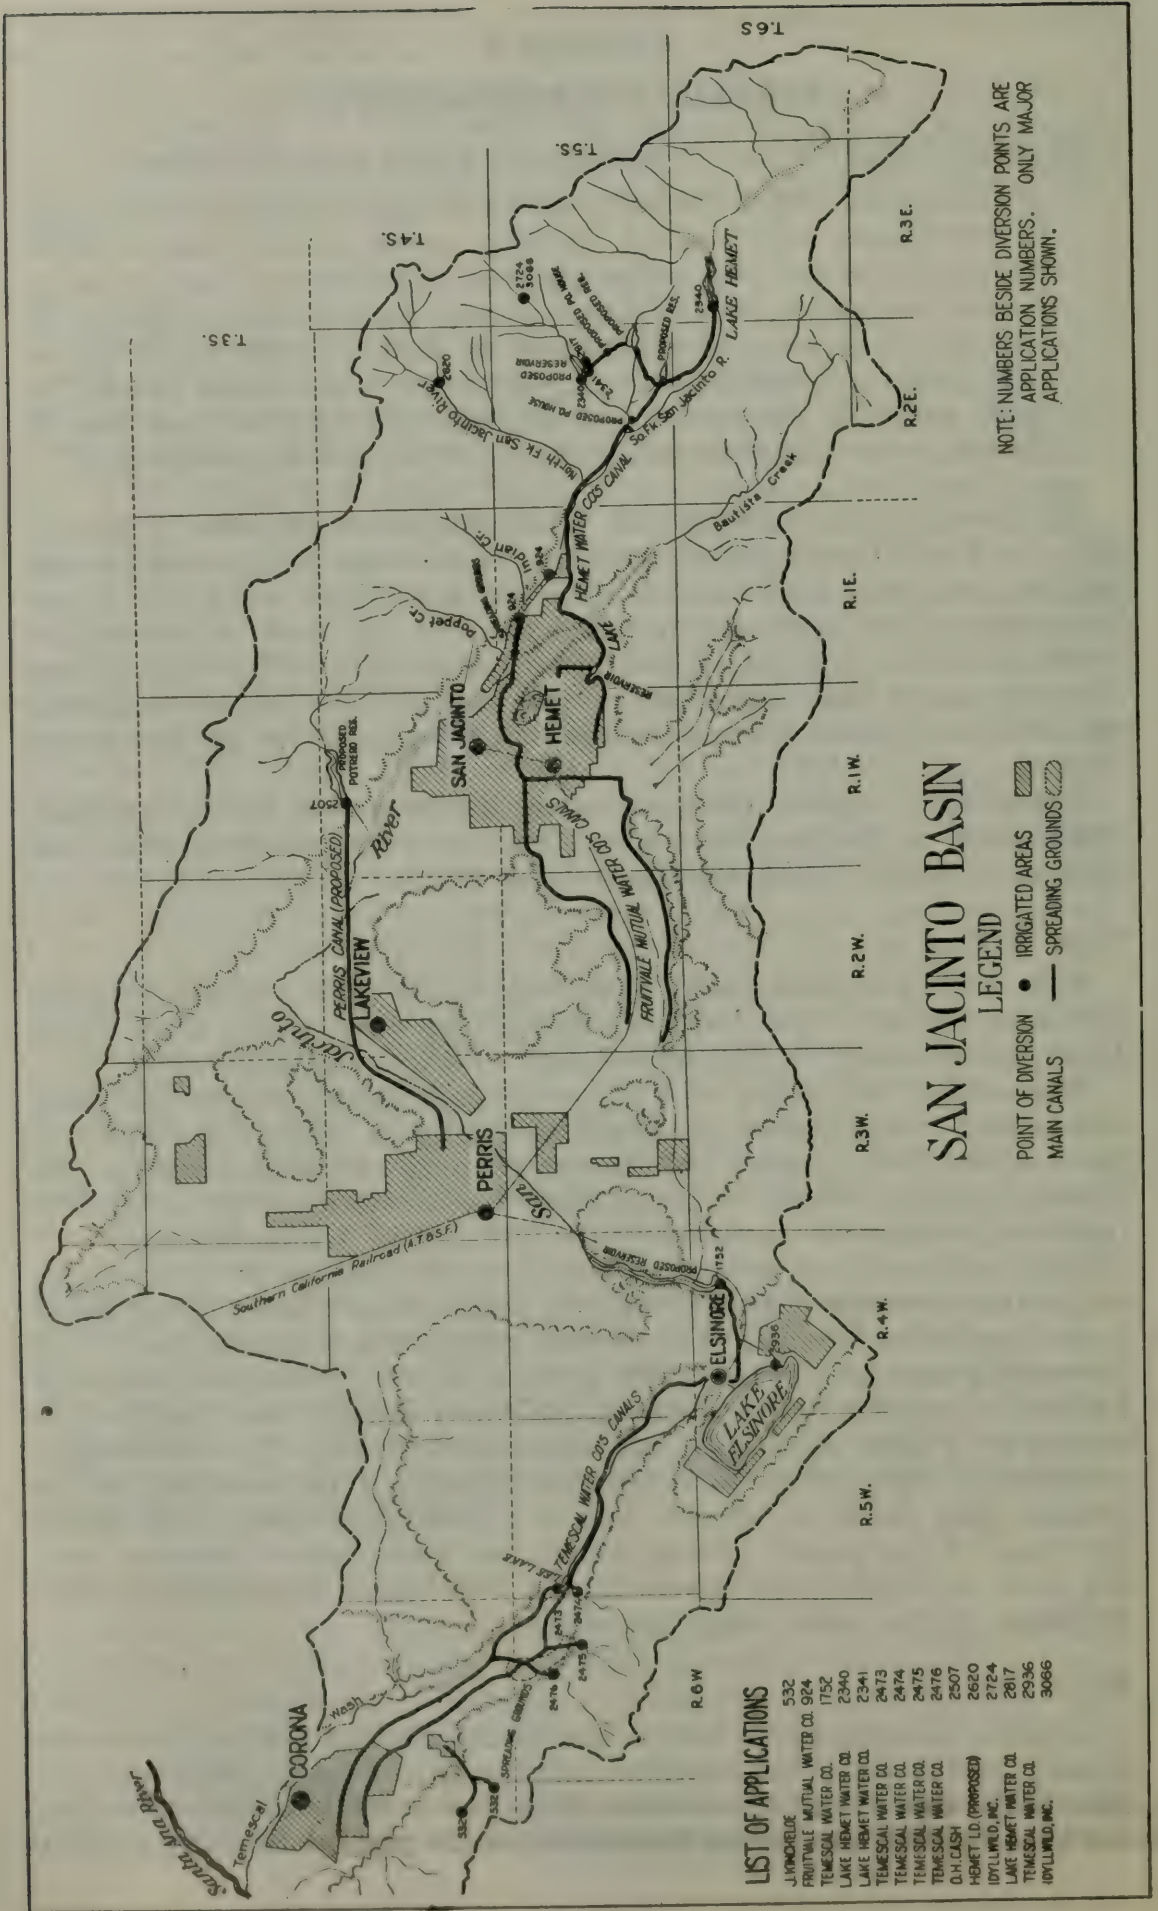

PLATE 5A

water flows into Lake Elsinore, and is there disposed of by evaporation. The general situation is outlined on Plate 5a, page 46.

The flow of the river is "flashy," varying widely between wet and dry years. The average annual discharge is about 50,000 acre-feet, a large part of which sinks in the stream channels and furnishes the underground supply for a large amount of irrigation by pumping.

Problems of water development on the San Jacinto are similar to those met with on all the streams of southern California, and it is believed that some description of the conditions along this river will be of interest because the underground water situation in southern California has become a major problem in the development of the state's resources. Many of the baffling underground water problems discussed in Chapter X of this report are encountered on the San Jacinto River.

Three comparatively large mutual companies are serving the major portion of the land irrigated from the San Jacinto River. These are Lake Hemet Water Company, the Fruitvale Mutual Water Company and the Temescal Water Company.

The Lake Hemet Water Company diverts from the natural flow of South Fork, Strawberry Creek and North Fork, and has storage on the South Fork in Lake Hemet. The lands served consist mainly of orchards in the vicinity of Valle Vista and Hemet. This company has an application before the Division of Water Rights for the diversion of water from Strawberry Creek to Lake Hemet in order to increase the storage available for their use. It is also proposed to develop power in connection with this diversion. The Fruitvale Mutual Water Company, which serves lands near San Jacinto, obtains its supply by direct diversion from the River, from submerged dams and tunnels and by pumping from wells. In order to increase the supply available from these underground sources the company has spread the flow of San Jacinto River on areas of coarse material adjacent to the river channel. Application for such use was made in 1917 and a permit issued by the then State Water Commission. The Temescal Water Company has wells located near the San Jacinto River in the Perris Valley from which it conveys water to Corona. An application for storage in Railroad Canyon, which connects Perris and Elsinore valleys, has been made by this company and is now before the Division.

In addition to these three companies there are many individuals and smaller organizations which are pumping from ground water in the area dependent on the San Jacinto River drainage basins. Some of these areas secure artesian flow. In others pumping has resulted in a general lowering of the ground water to such an extent that costs are becoming excessive and the quality of the water is affected. Lands in the vicinity of Perris have applications before the Division to spread the storm waters of the river, and also for surface storage on Potrero Creek. It is proposed to use the surface storage, together with the spread waters which will be recovered by pumping, to replace the supply which has been pumped locally for use on these lands. There is some pumping around Lake Elsinore, the largest organization for that purpose being at the southeastern end of the lake. As the lake is supplied from the surplus run-off of the river, which is disposed therefrom by evaporation, any reduction in the present inflow would detract from the attractiveness of the lake. Therefore the interests which have the

mineral baths at Elsinore are opposed to further use of the water in the upper part of the drainage basin for irrigation.

All the applications pending before the Division have been extensively protested by all other interests on the river. In connection with these applications and protests the Division in 1921 made a field investigation of the conditions on the river and this disclosed that the necessary information on which the office could base its conclusions was not available. A meeting to which all interested parties were invited was arranged at Riverside in August, 1921. The situation was outlined and a cooperative investigation suggested which would cover a study of run-off and ground water conditions. As a result of the meeting an agreement was entered into between the five principal interests on the river and the State Department of Public Works providing for an investigation by the Division of Water Rights to be made with sufficient thoroughness to furnish a basis for conclusions on the extent of the water resources and the feasibility of their more complete utilization. The cooperating parties were the Temescal Water Company, the Elsinore Valley Water Users' Association, the Perris Valley Chamber of Commerce, the Fruitvale Mutual Water Company and the Lake Hemet Water Company, each of which furnished one thousand dollars. The Division of Water Rights has furnished two thousand dollars from its general investigations fund and the Division of Engineering and Irrigation has contributed one thousand dollars and also the use of an automobile and other equipment.

Field work was begun in October, 1921, and has been continued up to the present time. It is now practically completed and the report will be finished in January, 1923. A large part of the work has been directed toward a study of the ground water and the effect of spreading as practiced by the Fruitvale Mutual Water Company. Observations of the fluctuations of wells over the full area have been made, the extent of draft on the ground water canvassed, measurements of run-off made, and available existing data assembled. The season of 1921-22 was one of unusually large run-off, so that the conditions for replacement of ground water have been more than usually favorable.

Lopez Creek.

Another underground water problem was presented to the office in the application of the City of San Luis Obispo to divert water from Lopez Creek.

The recent series of dry years and the growing needs of the city created a serious shortage in municipal supply, and it was proposed to tap the natural flow of the nearest adequate source, which is Lopez Creek. However, Lopez Creek furnishes the principal irrigation water supply for the very rich agricultural area in Arroyo Grande Valley. Existing data were not sufficient on which to base action by the Division, and the conditions of very evident need by a city, opposed by a determined organization of riparian users, promised bitter and long drawn out litigation. The physical situation was complicated by the fact that during the summer months the flow of Lopez Creek in its lower channel was beneath the surface of the ground.

With funds provided by the applicant, and material field assistance from the protestant's organization, a short field investigation was

made by the Division, which showed it to be inadvisable to grant the application as it was presented. The applicants are now considering a modified plan involving storage.

San Joaquin River.

A study of the San Joaquin River was begun in June, 1920, at the request of the Madera Irrigation District. This was undertaken in the same way as that on Kings River just referred to and with the intention of securing data which would aid in defining rights preparatory to the proposed construction of Millerton Reservoir on the San Joaquin. This is going on still and has been under the charge of Harrison Smitherum, assistant hydraulic engineer of the Division of Water Rights. The work is treated fully under Chapter VIII, which has been devoted to an article by Mr. Smitherum.

The increasing value of the work, as the engineer and his assistants become thoroughly familiar with the difficult and peculiar local problems and are able to devote special study to their solution, should not pass without mention. The continuation of the investigation until it fulfils its original purpose is to be earnestly recommended.

Return Flow in the San Joaquin Valley.

The importance of this phenomenon was brought to the attention of the Division as a result of a number of applications received for the appropriation of water from the lower reaches of the San Joaquin River and tributaries. Measurements have been made since and including 1920.

The subject of return flow and the results obtained in the investigation are given in considerable detail in Appendix III "Return Water in Lower San Joaquin Valley". The magnitude of the return flow shows its importance as a source of supply. It is expected that this study will be continued, in greater detail than in the past, to such time in the future as will allow the formation of definite conclusions regarding the possible increase of this flow with the expansion of irrigation development in the valley.

Use of Water in the Sacramento Valley.

The rapid increase in irrigation development in the Sacramento Valley during the last decade, and the part which the rice industry has played in this development, has resulted in a considerable amount of work in the valley by the Division of Water Rights.

The majority of the acreage irrigated is under permit from the Division, the appropriations having been initiated subsequent to the passage of the Water Commission Act. Realizing that the irrigation of rice required a larger amount of water than that for general crops, the first permits were issued on the basis of one second-foot to forty acres, with the proviso that the amount granted could be reduced at the time of issuance of license if investigation so warranted. There was a considerable overlap in lands included under different permits which could only be straightened out by a familiarity with local conditions.

During the summers of 1921 and 1922, inspections were made of all projects diverting under permit from the Division, and a great deal

of data collected especially upon the use of water for rice and the general development of rice irrigation.

Results of this work, and of the work of the Emergency Water Conference in 1920, are discussed in Appendix II.

The high prices prevailing in 1918 and 1919, resulted in the planting of rice on lands which under normal conditions would be better suited to general crops, and upon which an excessive quantity of water was used. The crop was a new one in the state, and lack of long experience in its irrigation did not encourage a most economical use.

The final duty of water allowed under licenses for irrigation of rice will have an important effect upon the acreage which can be irrigated in the valley. No definite conclusions have been reached regarding the duty to be allowed as yet, it being felt that further information is desired upon use under more stable conditions before final determination.

Salinity in Sacramento-San Joaquin Delta.

The investigation of salinity conditions in the Sacramento-San Joaquin Delta was first undertaken in a comprehensive manner in the summer season of 1920, which was a year of unusually low summer flow in both the Sacramento and San Joaquin Rivers. This work has been continued during the past two years, which were both characterized by a considerably greater summer flow. There has thus been afforded an opportunity to observe the salinity conditions in years of varying river discharge. The effect on salinity of the increased summer flow is plainly reflected in the graphs accompanying Appendix I herein. A brief description of the investigational work carried on in this connection, and some conclusions drawn as a result thereof, are also included in Appendix I.

The increasing salinity content of the water supplies of the Delta is a grave problem confronting not only this region but the entire Sacramento-San Joaquin system. It is of great importance to the state that irrigation development on the upper streams be allowed to proceed while it is equally important that the vast enterprises and investments in the delta below be not endangered. The facts established by this investigation will be necessary in the final solution of this serious problem.

Indian Wells Valley.

At the request of the settlers in this region, a comprehensive water supply investigation is being carried on under the direction of the Division of Water Rights.

The Indian Wells Valley is in Kern County, and lies just east of the Sierra Nevada Mountains about half way between Los Angeles and Bishop, in the north of Inyo County. It contains a large area of fertile but arid land, and many attempts have been made within recent years to obtain an irrigation supply. The eyes of the landowners of the Indian Wells Valley have turned naturally toward Mono Lake to the north, where there is a comparatively large water supply, at the present time unused. However, Mono Lake is nearly 200 miles distant from the valley, and it is at once apparent that it is not feasible economically to transport the available supply this great distance.

for agricultural purposes alone. There exist, however, at several points along the line which such a canal would take, possibilities for the development of hydroelectric power, the value of which would contribute materially toward the expense. The whole project thus hinges on the power possibilities. There had been no investigation of this feature, however, and there was only a rough idea of the water supply available and of the irrigable lands. To determine with definiteness whether or not Mono Lake offers a feasible source of water supply for the Indian Wells area, it was the desire of the residents that a thorough and impartial investigation be made of the whole project by the Division of Water Rights.

Accordingly, an agreement between the Kern County Farm Bureau and the State Department of Public Works has been entered into by the terms of which the farm bureau, in the interests of the proposed Indian Wells Valley Irrigation District and Fremont Valley will furnish funds, not to exceed \$7,000, for the investigation to be made by the Division of Water Rights.

The work has been placed in charge of Mr. John T. Whistler, formerly of the United States Reclamation Service, and is proceeding at the present time.

Water Supply for State Institutions.

The Division has been called upon at various times to advise relative to water supply or water rights of various state institutions. Some of these institutions have grown to considerable size and the problems encountered in securing an adequate water supply are similar in their diversity to those of cities of from five to ten thousand population under the wide variance in California conditions.

A thorough investigation was made of possible sources of supply and an estimate of cost prepared for Pacific Colony near Pomona, Los Angeles County.

Assistance was rendered in a similar investigation of the enlargement of the supply for the Napa State Hospital and Veterans' Home near Napa, Napa County.

Other investigations were made as to water rights and supply at the following state institutions:

San Quentin State Prison.

Folsom State Prison, at Folsom.

Whittier State School, at Whittier.

California Polytechnic School, at San Luis Obispo.

Mendocino State Hospital, at Talmage.

Preston School of Industry, at Ione.

CHAPTER VI.

COOPERATION WITH FEDERAL DEPARTMENTS.

U. S. Forest Service.

The cooperation which is received from the United States Forest Service is of a most valuable character and should not pass without acknowledgment.

Forty-one out of every hundred applications received by the Division are for appropriation within one of the nineteen National forests lying within the state, and the Forest Service renders to the Division a report upon each of such applications.

When an application is received for an appropriation within a National forest it is at once referred to the supervisor of that forest and further action is delayed pending receipt of his report.

This report includes the names of parties who may be affected by the proposed diversion and note of any special conditions which should be known by the Division before taking action. Definite recommendations are also included where the public may be affected by the proposed diversion.

Such investigations by men of local experience cover remote areas generally inaccessible and it would be difficult to overestimate the service thus performed without expense to the state by these agents of the federal government.

U. S. Geological Survey.

The water resources branch of the Geological Survey has developed a highly efficient and well organized corps of experts specially trained in the measurement of flowing water. Originally this organization operated entirely with funds furnished by the federal government but as the importance of the records secured became apparent came a demand that more gaging stations be established. The work grew beyond that which could be handled with the funds supplied by the federal government and local interests have contributed to the increasing costs while the execution of the work has remained in the hands of the Geological Survey. The Division of Water Rights contributed at the rate of \$10,000 per year to the furtherance of this work in California during the biennium.

Mr. H. D. McGlashan, district engineer for the Geological Survey, has made a report to the Division as to the work done under his direction toward which this office contributed funds and this is of such interest in showing the phases of development which his work is designed to help that this report is given in full in Appendix IV.

Federal Power Commission.

In June, 1920, the long awaited act which authorized the Federal Power Commission became a law. This act defined the methods by which right of way across the *lands of the government* can be secured for power project developments. The State of California in the Water Commission Act of 1913, and amendments thereto, had defined the method by which the *waters of the state* can be appropriated for power and other uses.

DIVISION OF WATER RIGHTS
DEPARTMENT OF PUBLIC WORKS
STATE OF CALIFORNIA
DIAGRAMMATIC PROFILE
THE YUBA DEVELOPMENT CO.
YUBA RIVER PROJECT

For some years power development had been retarded by the failure of the federal government to pass such a law as that embodied in the Power Commission Act and during that period the growth of population in California had been rapid and the increase in prosperity great. There had grown up an increased demand for electrical energy.

To operate a power project an owner must have two rights. He must have a right of way for his works and he must have the right to divert water from a stream. Applications for diversion of water for power before the Division of Water Rights had been of comparatively minor consequence for several years, but with the passage of the act there were initiated a flood of new power projects. For the year previous, in anticipation of the passage of the act, activity had been large.

This activity is evidenced by the records of the Division of Water Rights which summarize as follows:

TABLE 5.
Summary of Theoretical Horse Power Applied For.

	Theoretical Horse Power	
From the passage of the Water Commission Act in 1913 to July, 1919, applications were received for	2,000,000	
In anticipation of the creation of the Federal Power Commission Act from July, 1919, to June, 1920, applications were received for	4,000,000	
From June, 1920, to October 1, 1922, applications were received for	6,500,000	
<i>Summing up:</i>		
Applications before the Division of Water Rights-----		12,500,000
Applications canceled	3,000,000	
Permits granted	2,200,000	
Applications acted on		5,200,000
Pending		7,300,000

Such a flood of applications found the Division unprepared but the personnel was increased as fast as possible to handle the work. The projects proposed are very complicated and in some cases contemplate the development of all the possible power in an entire river system as on the following streams:

Southern California—	Central California—	Northern California—
Whitewater River	Kern River	American River
Santa Ana River	Kings River	Yuba River
Sespe and Piru Creeks	San Joaquin River	Feather River
Owens River	Mokelumne River	Pit River

The plat on the preceding page shows a diagrammatic sketch of a project proposed by the Yuba Development Company on the North Yuba River, which is among the more comprehensive projects before the office. The plans serve well to illustrate the complexity of the proposed project, which will develop almost as much hydro-electric power as is now developed by the largest power company in the state. There are others of corresponding magnitude.

Naturally, even to keep the records of the Division clear, when projects of such magnitude are before it, requires a personnel of considerable engineering experience. Such comprehensive developments will add greatly to the wealth of the state but at the same time the effect on established conditions will be marked, and the results which will accrue to the future development of water for the other natural resources may or may not be beneficial.

The law authorizes the Division of Water Rights to see that the waters of the state are developed to best utilize the natural resources of the state. The Federal Power Commission is invested with still broader powers and is authorized to use its powers to prohibit any power development which does not fit in well with any ultimate ideal development of all the economic possibilities; that is, irrigation, mining, flood control and miscellaneous interests must and shall receive consideration.

The Federal Power Commission exercises its power on practically all of the power streams of California through ability to grant or to withhold right of way over public lands. The Division of Water Rights exercises its authority through its jurisdiction over the diversion of the waters of the stream. A grant of right of way by the Federal Power Commission would be worthless were the state to refuse a permit to divert its waters through a proposed conduit and likewise a permit to divert water would be inoperative if the permittee did not also have a right of way.

This condition of divided authority has necessitated and developed the closest cooperation between the Federal Power Commission and the Division of Water Rights. Almost one-quarter of all the projects filed before the Commission, and originating from all points in the United States, are in California. This has entailed an enormous amount of work, not only to state authorities but also to the local representatives of the Commission, and to the Washington office. This cooperation has materially simplified procedure before the two bodies and has expedited and harmonized action.

Simultaneous action has been expedited by a constant series of informal conferences between the two bodies. On some of the larger projects joint hearings have been held before representatives of the two offices. All parties in interest realize that this close cooperation exists and that every effort is being made by both organizations to avoid delay. Altogether seventy-eight projects from California have been filed before the Power Commission. This involves a vastly greater number of applications before the Division of Water Rights but these have been grouped into projects to correspond with the projects before the Federal Power Commission. Of these projects, nineteen are for various reasons not before the Division of Water Rights, being for transmission lines or having vested or riparian rights, fifteen have been given permits by this office, six have been canceled, and the remaining forty-eight have not yet been acted on, in most cases because the applicants have not yet finished the extensive surveys necessary to complete their applications. In addition to projects which are before both the Federal Power Commission and this Division, there are some forty or fifty in the preliminary stages before the Division but not yet before the Commission.

Most of the larger power developments embody extensive reservoirs in the headwaters of the streams, and because of increased summer flow made possible by these reservoirs, irrigation in the valleys will be benefited provided that works are constructed to smooth out the irregularities of flow incident to power operation. However, in some parts of the state the power reservoirs must be supplemented by reservoirs to recontrol the water for irrigation before this benefit can be fully operative. This hinges on the stage of development of irrigation up to the present time and the relative abundance of water as compared to the irrigable land.

This varies in different parts of the state. In northern California, that is, in the Great Valley north of San Francisco, the total annual flow is large compared to the area of land, therefore, any reservoirs which will increase the late summer supply will help irrigation. On the streams flowing into the Sacramento Valley, there are in few cases feasible large reservoirs low on the streams to re-regulate the discharge from the power plants for the demands of irrigation, but in most cases it is probable that regulation for power only will closely approximate the demand for irrigation of all the lands which can be irrigated from the streams on which the power projects are located, and thus that only minor regulation is necessary. An exception to this is the upper end of the main Sacramento River and on this, fortunately, there exists the Iron Canyon reservoir site which is now proposed as a part of the full development of the Sacramento Valley.

In this section of California there are considerable areas of foothill land susceptible of irrigation but the expense of development is so large that it has lagged. If power development goes ahead, the irrigation of some of these areas will be impeded because power will have acquired vested rights to the waters. Where any activity has been manifested in the irrigation of these areas, this has been helped as much as the law allows but it would be impossible and undesirable to hamper power development, which is needed now, for the benefit of possible future, but at present unplanned and unfeasible irrigation.

In Central California the San Joaquin Valley has large areas of land in excess of that which can be irrigated from the streams of the valley, and here the area of foothill land irrigated will be small. Some of these streams are very suitable to power development and the irrigated area in the valley is large. An irrigation practice has grown up suited to the natural flow of the river so that interference with the natural run-off by storage will in some cases upset existing practice. Fortunately, on most of the streams there are large and comparatively cheap reservoir sites in the foothills below the main power drops, and these when built can be used to regulate for irrigation the equated flow from the power reservoirs. The power reservoirs will supplement these larger reservoirs in controlling the streams. In some cases it has been necessary to refuse permits temporarily for storage to bona fide power projects until such time as the larger irrigation reservoirs below the proposed power plants have been constructed or some agreement has been reached. In these cases the power interests are keenly alive to the exigencies of the situation and have shown a helpful and cooperative spirit, realizing that the course adopted is for the best public interest. This situation exists on Owens, Kern and Kings rivers.

While the policy noted above is obviously one which protects and fosters irrigation, yet there are cases where power may suffer from certain phases of development of irrigation districts, and where the ultimate power possibilities can and should be protected. On some of the less favorable power streams in the San Joaquin Valley, reservoirs for irrigation are now being constructed or are proposed on the lower reaches for irrigation. These reservoirs will also be used to supply lowhead power plants and a vested right to the surplus waters of the stream will thus be acquired. Eventually demand will arise for power development above and this will be restricted by the vested right below which will inhibit proper regulation for power by means of upper reservoirs unless proper control is exercised in the initial stages.

In Southern California and in the Coast Range power will help irrigation. In Southern California water is used for irrigation during almost the entire year. The demand corresponds more closely, therefore, to the equated flow desirable for a power plant and while water is always insufficient it is to be expected that here the two will proceed hand in hand in the development of reservoirs, eventually without conflict.

Throughout the state these power reservoirs constitute an important feature of the ultimate flood control of the state. This is particularly the case in southern and central California. In central California the ratio of reservoir capacity which will be built for both power and for irrigation is large as compared to stream discharge and with proper regulation it will add measurably to the factor of safety which has been adopted by the Reclamation Board in its plans for flood control in the San Joaquin Valley.

CHAPTER VII.

WORK OF STATE DIVISION OF WATER RIGHTS ON KINGS RIVER.

By CHAS. L. KAUPKE, Water Master.

Kings River is one of the largest streams entering the San Joaquin Valley. It heads on the north slopes of Mount Whitney and is joined by several large tributaries giving the water shed a roughly fan-shaped outline and embracing about 1740 square miles, of which more than half is in the high Sierras. This region receives heavy snowfalls during the winter months, which melt but slowly, and consequently, in average years, the river does not reach its highest stage until the middle of May or first of June. The mean annual discharge is 1,900,000 acre-feet. Under the present conditions the mean annual diversion is 1,400,000 acre-feet resulting in a surplus of 500,000 acre-feet. A total of more than 45 canals, with an estimated capacity of 10,000 second-feet, divert from the river and irrigate 650,000 acres. The extent, variety, and value of the crops grown by means of the water furnished by this river give to it a rank second to none among the streams in the state.

About 20 miles east of Fresno the river debouches from the foothills of the Sierra Nevada Mountains and enters the Centerville Bottoms. These bottoms, which have a length of eight miles and an average width of three miles, are depressed below the general surface of the San Joaquin Valley plain about ten feet at the upper end and sixty feet at the lower end. The river flows through the area in several channels. The soil is very fertile and irrigation on Kings River was first begun here. Just below the bottoms the river is again confined in one channel and enters the "Reedley Narrows." The Narrows extend from a point about three miles north of the town of Reedley to the Southern Pacific Railroad crossing southeast of Kingsburg. The depth of the Narrows below the valley plain is 60 feet at the upper end and 10 feet at the lower end. The remainder of the river channel is in a flat alluvial cone.

Irrigation on the uplands or plains was first begun in the early seventies on the north side in the vicinity of Fresno and also west of Kingsburg, and on the south in the Hanford area. The bed of the river, outside the Reedley Narrows described above, being but little below the general level of the country, diversions were readily made at almost any point. The plain land being very fertile produced abundantly when irrigated, and rapid development resulted. Within the next ten years several large canals were completed and thousands of acres were irrigated.

The Rancho Laguna de Tache, a Spanish grant, commonly known as the "Laguna Grant," situated on the north bank of the river, in the vicinity of Laton, is the largest area of riparian land bordering on Kings River. For many years it was the source of great expense and annoyance to the canal companies and early settlers; nearly all the important canals were enjoined from diverting water from the stream. However, in nearly every case "a way out" was found and diversions were maintained and irrigation development extended. About 1892 the Fresno Canal (one of the largest on the stream) was purchased by

English capitalists and in order to improve their water rights these interests also purchased the "Laguna Grant." During the next few years most of the canal companies made compromise settlements with the owners of the "Laguna Grant," or in some other way adjusted their appropriation so as to avoid further strife and litigation on account of the riparian rights. However, litigation over riparian rights was by no means the only litigation over the waters of Kings River. As the country developed and the canal diversions increased the water supply was insufficient to give the settlers the quantities which they deemed necessary for their needs. Especially was this true with the late summer run, beginning about July 15th of each year. There was thus produced great and lasting animosities between the several communities of settlers and owners along the entire valley course of the river.

In the early development little attention was given to the matter of water measurement or to the amount of water diverted from the stream, and the measurement of flow and the length of time it was diverted by any given canal was very difficult to ascertain with any degree of accuracy. Each engineer or canal superintendent was responsible to the water users under his canal to see that their full supply was being diverted. Such a method, while satisfactory as long as the flow of the river exceeded the combined capacity of all the canals, developed endless disputes and friction during low water stages.

Most of the agreements and rights are based on the flow at Piedra, the U. S. Geological Survey gaging station above the highest irrigation diversion. The gage reading at Piedra is made and reported by the Weather Bureau at seven o'clock each morning, and diversions are made in accordance therewith until the next morning. During the spring months there is a large diurnal variation in the flow caused by the changes in the rate of snow melting, due to difference of temperature between day and night. The difference between the daily maximum and the minimum flow, in extreme cases, amounts to 50 per cent of the minimum at medium stages of the river. The maximum occurs in the morning and the minimum in the late afternoon or evening. As the official gage reading almost coincides with the maximum stage, when the river is affected by snow melting, the daily mean discharge is considerably overestimated. This condition is the cause of many of the difficulties encountered.

About the year 1900 a hydrographic survey was made of the Kings area by the U. S. Geological Survey, under the immediate supervision of Mr. J. B. Lippincott, as part of the general plan for ascertaining the water resources of the country, and the extent to which the arid lands could be redeemed by irrigation. The report was very favorable to the development of storage on Kings River. Two years later and immediately after the organization of the U. S. Reclamation Service, an appeal was made by certain public spirited citizens for federal aid. Mr. F. H. Newell, chief engineer of the U. S. Reclamation Service, responded and spent several months in endeavoring to establish cooperation and harmony between the many factions that had sprung up as a result of past litigation. But all efforts in this direction failed to accomplish the desired end and the Reclamation Service abandoned the project.

The extremely dry years of 1912 and 1913 forced the people to see the urgent need for storage if any further development were to be made. A mass meeting was called and an attempt made to have the people from the whole Kings River area attend. The results were not especially encouraging, but an organization was formed for the purpose of obtaining cooperation among the many conflicting interests on the stream. After three or four years of effort by public spirited men of the community an organization was created containing representatives of all the important interests, including the canal companies and riparian owners. This does not mean that they were agreed as to their respective rights; in fact they were wide apart, but they had begun to see the necessity for arriving at an agreement if litigation were ever to cease and further development be accomplished.

With the enactment of the California Irrigation Act, this organization resulted in the Kings River Conservation District Executive Committee. The first real task before the committee was a settlement by agreement of existing rights, as the storage scheme contemplated that these rights should remain intact. Most of the low and medium stage water rights had been defined by court decrees, judgments and agreements, but no complete data were available showing to what extent diversion and use had conformed with the claimed rights. It was apparent that accurate records should be kept from year to year of all water diverted and that it would be desirable to have this work done by a state agency. A resolution embodying such a request was made at a meeting of the committee held in Fresno in October, 1917.

The State Water Commission responded and agreed to furnish the service of an engineer during the irrigation season of 1918, provided all of the appropriators or users of water would agree to cooperate in making complete measurements and records of all diversions.

The writer, as engineer for the State Water Commission, arrived in Fresno on December 27, 1917. The first step was to become familiar with the location and character of the various intakes. In this he was greatly aided by the officials and employees of the various irrigation companies. A number of canals were already equipped with gaging stations and most of the others immediately built stations in accordance with the request of the engineer. The Water Commission, through a cooperative arrangement, secured the use of twenty-one water stage recorders from the Bureau of Public Roads, U. S. Department of Agriculture, a sufficient number to place one on each canal to be measured and not already so equipped. With the coming of warm weather the number of canals diverting and the area irrigated increased rapidly.

Those canals diverting near the foothills have clean channels, permanent cross-sections, and relatively high velocities, and the ratings show very little change from year to year. On the lower river, canal gradients are very flat—in fact, in most cases less than one foot per mile. Raising or lowering a checkgate two or three miles down the ditch may have a noticeable effect on the rate of flow at the intake. At high stages of the river large quantities of sand are deposited in the upper reaches of the canals. In the late spring and early summer months, aquatic plants and tules grow abundantly, greatly decreasing the rate of flow. All these are factors in changing the rating. In one instance, no less than ten rating curves were used in a year.

Daily diversion records were kept during the year 1918 on the following canals: Alta, Gould, Fresno, Consolidated, Lake Lands, Peoples, Last Chance, Emigrant, Lemoore, Grant, "A", Island, Liberty, Turner-Riverdale, Little Mill Race, Big Mill Race, Reed, Crescent, Stinson, Beta Main, Jap, and Carmichael Slough. No satisfactory results were obtained on Beta Inside, Empire Canals Nos. 1 and 2, Blakely and Tulare Lake canals.

At the end of the calendar year 1918 the data obtained under the immediate supervision of the writer were compiled in a printed report by the Water Commission and copies were made available to all interested parties. It proved to be valuable information, as each appropriator, knowing how much water he had used, could form a fairly accurate estimate as to his requirements. The irrigation interests fully realized that this work was just what was needed and that it should be continued over a period of years. The agreement with the Commission was renewed and the work was continued through the year 1919.

The run-off during the year 1919 was considerably below the normal; in fact it was only a 58 per cent year. By the beginning of July there was not water enough to supply canals who were entitled to all of the low flow. This situation annually resulted in friction and disputes, which in recent years were greatly aggravated by personal animosities. These companies fully appreciated the necessity for giving to an unbiased and disinterested agency the authority to supervise the division of the water at low stages of the river. The State Water Commission, having through its local representative acquired the confidence of these people as to its integrity and ability, appeared as the logical agency to undertake the work. A meeting of the interested parties was called on July 28th, at which the chairman of the Commission presided. The engineer of the Commission was given authority to act as water master during the remainder of the year 1919, and to distribute to the canals entitled thereto the flow of the river up to the two thousand second-foot stage at Piedra in accordance with a schedule mutually agreed to.

This, however, was only a beginning. Engineers and others interested immediately set to work to extend the schedule. The reasons for this can be ascribed largely to the recognized need of settling all existing water rights on the stream prior to the construction of the proposed Pine Flat Storage project. Such a settlement had not been accomplished through fifty years of expensive court litigation, during the course of which 137 suits had been initiated. Several schedules were proposed, only to be rejected as unsatisfactory by one or more rival claimants to the water. Sentiment, however, in the meantime, had grown strongly in favor of adopting such a schedule. On October 18th a meeting was held, at which nearly all canal interests having established rights were represented. The meeting unanimously passed resolutions declaring itself in favor of agreeing on the adoption of a schedule of distribution, and placing its operation in the hands of a water master, acting under the authority and supervision of the State Water Commission. It was also decided that a working committee be selected, consisting of one member for each company. Plans of procedure were discussed, which led to the decision that each company present a tentative schedule of its rights, to serve as a basis for discus-

sion. The committee also went on record as desiring and requesting that the engineer of the Commission be employed for the year 1920 to carry on and continue his work and water measurements on Kings River.

Beginning with the year 1920, the scope of the work was considerably enlarged. Measurements were made and records kept of diversions on the lower river where no satisfactory results had been obtained heretofore. To furnish data especially desired by the Schedule Committee, measurements were made of diversions in Centerville Bottoms and of seepage losses and return waters from the river channel.

Much of what precedes is in a sense contemporary history and is given here briefly to show the sequence of events leading up to the most important step yet taken by the irrigation interests on Kings River, as regards a settlement of disputes on water rights—the adoption of the schedule agreement.

Several meetings were held by the executive committee, and the engineers and attorneys, who had organized themselves into a board of engineers, and board of attorneys, were busy on the work assigned to them, when it was announced that the riparian suits (*Stinson & Crescent vs. Lemoore*) were set for trial in October.

It was very apparent that if these suits came to trial, long and expensive litigation would result. No further progress on the organization of the storage project would be made in the meantime and the benefits of much of the valuable work already done would be lost.

At a meeting of the board of engineers, the gravity of the situation was discussed and a committee consisting of Messrs. J. B. Lippincott, L. A. Nares, and Chas. L. Kaupke, was appointed to prepare a tentative agreement to be made and entered into by all water users on Kings River. This agreement provided that pending litigation be postponed, that all water users submit arguments to the State Division of Water Rights (formerly State Water Commission), setting forth their claims to the waters of Kings River, and that the Division of Water Rights be requested to prepare a temporary schedule for the division and administration of the waters of Kings River for the year 1922. After being prepared by the legal department of the Division of Water Rights, it was resubmitted to the committee, the board of attorneys, and the board of engineers, and by them approved. Copies were then sent to each and every interest on the river with the request that it receive earnest and immediate consideration and also advising the recipients that a meeting would be held at an early date at which every interest claiming rights to the waters of Kings River would be requested to sign the agreement. The meeting was held on September 27, 1921. In less than two hours time thirty-five signatures were affixed, representing more than 95 per cent of the appropriations and an area of more than 1,000,000 acres.

The following is an abbreviated text of the agreement:

WITNESSETH:

That whereas, during the last twenty years the water users on Kings River have been endeavoring to reach agreements that would permit of the construction of the Pine Flat Reservoir for the conservation of the flood waters of Kings River, without successful accomplishment, the principal difficulty in connection therewith being the failure to agree on a schedule for the division of the waters. * * * The

schedules that have been presented during the past few months have no fundamental or radical differences that apparently would justify failure to reach some final conclusion and it is, therefore, believed that some independent and impartial authority would have no serious difficulty in harmonizing them; and

Whereas, * * * Said State Water Commission and Division of Water Rights have collected accurate and extensive measurements of the water of all the canals diverting water from Kings River during the past four years. Their records have been accepted as accurate and satisfactory; and

Whereas, in addition, the Division of Water Rights had at its disposal numerous other state records as to the duty of water and the areas irrigated. By agreement of the parties interested, this Division has had charge of the distribution of the waters of Kings River up to a flow of 2000 cubic feet per second, measured at Piedra, and this service has been satisfactorily performed. The Division of Water Rights as the successor of the State Water Commission is the agency contemplated under the law of the state as the proper authority to which to appeal for the distribution and administration of the streams of the state among water users; and

Whereas, * * *

Now Therefore, the various canal organizations and individuals who are diverting water from Kings River, together with the owners of riparian lands thereon, in order to avoid litigation, strife and expense, and to accomplish a more just and effective distribution of the waters of the river to those entitled thereto, and to assist in the efforts for the construction of a storage reservoir on Kings River for the conservation of flood waters and the development of underground water supply by pumping, and in consideration of the premises and the mutual covenants herein contained hereby enter into the following agreement for the preparation of a temporary schedule for the division of the waters of Kings River and its administration for the calendar year 1922, and it is hereby agreed:

(a) That all corporations, districts, individuals and riparian owners, claiming rights to the waters of Kings River, submit arguments to the said Division of Water Rights of the Department of Public Works setting forth their claims to the waters of Kings River.

(b) That the Division of Water Rights be requested to prepare a temporary schedule for the division of the waters of Kings River for the year 1922.

(c) That this temporary schedule, which is to be prepared, may be varied by the Division of Water Rights to meet the requirements of different districts or sections of the area irrigated from Kings River for different seasons of the year.

(d) That the acceptance of this agreement binds the parties signing it to the acceptance of the temporary schedule to be prepared by the Division of Water Rights, but on January 1, 1923, any canal company, individual or riparian owner, claiming water rights to Kings River, who has signed this agreement, may withdraw by serving on said Division of Water Rights written notice of intention to withdraw, which notice shall be served on or before October 1, 1922. As to all parties who have not withdrawn as aforesaid, the schedule shall continue in force from year to year, but any party shall have the right to withdraw at the end of any calendar year by giving the three months notice as herein above provided.

(e) * * *

(f) That the Division of Water Rights shall put a water master in charge of the river to interpret and administer the schedule and have control of the diversion works of the various canals.

(g) That any canal company, individual water users or riparian owner may appeal to the Chief of the Division of Water Rights from any decision of the water master, in which event all interested parties shall be notified by the Division of Water Rights so that they may be present at the hearing which shall be held by the said Chief of Division, and the decision of the said Chief of the Division shall be final.

(h) * * *

(i) * * *

(j) * * *

(k) * * *

The Division of Water Rights accepted the task imposed upon it by this agreement, and after careful study of the evidence, arguments and

**SCHEDULE FOR DIVISION & ADMINISTRATION
OF THE WATERS OF THE KINGS RIVER FOR THE YEAR 1922**

PLATE 8

documents submitted, and the diversion records of the canals during the past four years by the Division of Water Rights, prepared a schedule and appointed the writer water master to administer the same.

As provided in section (b) of the agreement a budget, to the amount of \$15,000, covering estimate of cost of administering the schedule and work incident thereto, was submitted to the executive committee and unanimously approved. In prorating the assessment among the various water users the work was divided into two divisions, with one-half of the assessment allotted to each.

(1) Administration of the temporary schedule prepared by the Division of Water Rights for the year 1922.

(2) Collecting engineering data to aid in the permanent settlement of water rights and for the consummation of the Pine Flat Storage project. Under division (2) it is contemplated to obtain:

- (a) Complete records of daily diversions by all canals.
- (b) Division of water between North Fork and the South Fork of lower Kings River.
- (c) Flow into Tulare Lake and the San Joaquin River from Kings River.
- (d) Flow into Tulare Lake from other sources.
- (e) Return water studies.
- (f) Maintenance of automatic water stage recorder on Kings River at Piedra.

The assessments levied on the various irrigation interests have been promptly paid, thus providing ample funds to carry on the work. The water master perfected his organization as soon as the occasion demanded. Two assistants were employed soon after the beginning of the year: one with headquarters in Fresno and the other in Hanford. A gage observer was employed at Piedra, and telephone lines were extended which enabled the office to have reports of the gage reading on Kings River at that point twice daily, 6 o'clock a.m. and 6 o'clock p.m., and oftener if necessary. Automatic gages were installed on Cross Creek and Tule River. Superintendents, headgate tenders and other employees of the various canal companies made gage readings and regulated headgates and weirs as directed by the water master.

The schedule was rigidly administered from the beginning of the irrigation season until May 5th, and again from July 1st to the end of the calendar year. During the intervening period the river was in flood stage and the flow exceeded the combined requirements of the canals and little supervision was necessary. The water master and his staff, however, were exceedingly busy. Records were kept and engineering data obtained as outlined under (2). In addition to this, the reclamation districts on the lower river and grain growers in the Tulare Lake Basin area were daily advised of the stage of the river at Piedra and forecasts were made of any changes of stage of the river as it affected them.

At the time of this writing, near the end of the year 1922, the schedule agreement remains in full force and effect. Not one of the signers has seen fit to avail himself of the provision for withdrawing as provided in section (d) and in part as follows: "On January 1, 1923, any canal company, individual or riparian owner, claiming water rights

to Kings River, who has signed this agreement, may withdraw by serving on said Division of Water Rights written notice of intention to withdraw, which notice shall be served on or before October 1, 1922." For the purpose of furnishing complete information to the water users of this year's schedule operation, a report was prepared by the Division of Water Rights, giving the daily diversions by all canals, excepting those in Centerville Bottoms, the discharge of Kings River at Piedra, Elkhorn Grade and below Empire Weir No. 2, for the period of January 1 to July 31, 1922. The report was made available to all signers of the agreement in ample time to permit a careful study thereof prior to October 1st. The fact that no one has withdrawn is the source of much gratification to the Division of Water Rights, as well as to the signers themselves. It is evident that they believe the schedule, although not entirely satisfactory in its present form, to be a long step in the right direction, and that with some constructive revision it will ultimately bring about an amicable settlement of all water rights on Kings River, and thus prepare the way for the consummation of the Pine Flat Storage project.

CHAPTER VIII.

LOWER SAN JOAQUIN RIVER HYDROGRAPHIC SURVEY.

By HARRISON SMITHERUM, Assistant Hydraulic Engineer.

It is a matter of record from measurements made on the San Joaquin River at Friant and near Newman, over a period of years, that a large portion of the flow of the river runs to waste annually. Seeking to utilize some of these surplus waters for the irrigation of their arid lands, the proposed Madera Irrigation District in January, 1916, filed an application with the State Water Commission for the diversion of 5000 second-feet natural flow and 380,000 acre-feet annual storage of the waters of the San Joaquin River. In September, 1919, the proposed district filed another application for the diversion of 3000 second-feet natural flow and 500,000 acre-feet annual storage. Additional large filings were made by other interests. Little or no data were available as to actual diversions and it was deemed necessary that an investigation of the various diversions and use of water be made.

Such an investigation was also necessary to the Madera Irrigation District itself and on its organization, early in 1920, the district sought the cooperation of the State Water Commission, with the result that in June of that year a contract was entered into by which the District provided funds for a hydrographic investigation by the State Water Commission on the San Joaquin, Fresno and Chowchilla rivers. While the major part of the expense of the investigation has been provided by the district, the Division of Water Rights has also contributed a comparatively minor amount to the work.

Scope and Purpose.

The investigation was to deal principally with the main San Joaquin River, including its mountain drainage area and the San Joaquin Valley portion to the lower end of the valley, together with the two tributaries, Fresno and Chowchilla rivers. Measurement and study was proposed as follows:

- (1) Flow in main San Joaquin, Fresno and Chowchilla rivers.
- (2) Diversions from above named streams.
- (3) Present use of water for irrigation.
- (4) Effect on irrigation of release of storage water from power reservoirs.
- (5) Return flow from irrigation in the main San Joaquin, Merced, Tuolumne and Stanislaus rivers.

Cooperation.

In addition to money provided as just noted, both the District and the Commission have supplied water stage registers for the work. The water resources branch of the Geological Survey and the interests using waters within the area investigated have cooperated in establishing measuring stations and furnishing available records. Acknowledgment is made for information received and courtesies extended by the officials and employees of these interests.

Field work on the investigation began June 11, 1920. After a reconnaissance of the territory to be covered it was realized that

with the funds available, the nature of the country to be traversed and field conditions to be met precluded various phases of the work as outlined and it was decided that the major portion of the field work must be in the valley section and would be confined to the ascertainment of the discharges of the above mentioned streams and diversions therefrom.

The measurement of gravity diversions has been confined to controlled diversions, because of the number and character of outlets and the adverse physical conditions existing at many of them. The determination of the duty of water over the areas served by means of the measured flow at the intakes of canals is impossible, due to interchange of water between canals. These conditions are found only on the San Joaquin River and will be discussed later.

In addition to the measurement of the controlled gravity diversions from the streams in question, measurements on the San Joaquin River near Newman, in cooperation with the water resources branch of the Geological Survey, the Merced River near Livingston, the Fresno River at Madera, and the Chowchilla River above Buchanan, have been made. On Plate 9, page 66, will be found a map showing the territory covered by this investigation and the various diversions and measuring points.

SAN JOAQUIN RIVER.

The San Joaquin River, with a mean annual flow of 2,000,000 acre-feet at Friant and a drainage area of 1640 square miles, is the second largest stream of the valley.

Entering the plains below Friant, it flows southwesterly to the point of confluence with Fresno Slough and thence northwesterly to Suisun Bay. In its course to Suisun Bay the flow is greatly increased by many important tributaries draining the western slopes of the Sierras. During periods of peak run-off, the flow is further increased by an uncertain overflow from the Kings River watershed, entering through Fresno Slough. Tributaries from the west side are of little importance.

At Friant the river is shut in by bluffs, but it soon enters the low flood plain of the valley and at that point Gravelly Ford Canal diverts.

"The surface of the valley is in brief a combination of the surface of a great number of alluvial fans originating at the mouths of the canyons, through which the tributary streams discharge from the mountains into the valley."

"Each stream that enters the valley brings with it from the mountains a greater or smaller quantity of sand, gravel, or boulders. All or a part of this burden is deposited in the valley and the deposit constitutes the alluvial fan of that particular stream. The apex of each fan is the mouth of the stream canyon. From this apex it broadens and flattens until it coalesces at its periphery with other fans. The stream that built the fan usually spreads delta wise over it, discharging through a number of diverging channels into the trough of the valley." (U. S. G. S. Water Supply Paper No. 299.)

That portion of the San Joaquin Valley where are met the major problems of this survey lies wholly within the low flood plain of the river and its various tributaries. The stream is confined by low banks and cut by numerous sloughs, which, after running for a distance in

the same general direction as the river, reunite with it forming a broad swampy area which is often submerged. Canals, dams, levees and irrigation systems within this area have served to reclaim extensive areas. Other large areas of undeveloped or only roughly developed wild grass pasture lands still remain that are subject to inundation through river and slough outflow, together with water from controlled diversions.

Roughly, this flooded area extends along both sides of the river between the Aliso Canal and the mouth of the Merced River, except for that portion on the west side of the river between Mendota Dam and a point two miles above the head of Pick Anderson Slough.

Diversion points within this area are accessible only over difficult roads, which grow worse as the river rises. At flood stages these diversions can be reached only by boat or by horse drawn vehicle, the latter a hazardous undertaking without intimate knowledge of the country.

Between the Gravelly Ford Canal in section 8, T 13 S., R 17 E., and the mouth of the Merced River, many of the sloughs have been controlled and have become parts of irrigation systems. Others, while uncontrolled, are important factors in the irrigation of wild pasture lands. These, together with the artificial canals cut into the banks of the river, constitute the gravity diversions from the San Joaquin River.

There are fifteen gravity diversions controlled by structures; more than twenty uncontrolled sloughs, which take water at various stages of the river; innumerable small sloughs and overflow channels taking water only at extreme high stages; and all these divert from the San Joaquin River in that portion of its course between the Gravelly Ford Canal and the mouth of the Merced River, a distance by river of approximately eighty miles.

Problems Encountered.

The uncontrolled sloughs along both sides of the river present many difficulties of measurement. Diversion points are not readily accessible and a large portion of the water diverted is returned to the river. Many of the sloughs divert water from, or return water to, the river depending on the stage of the river and depth of inundation of the surrounding country. The areas served by these diversions are unprepared or only roughly prepared wild grass pasture, which are also subject to overflow and may receive return or waste water from controlled diversions. These latter present no unusual problems in the measurement of amounts diverted other than the difficulty of obtaining entirely satisfactory records of daily discharge which difficulty is due to operation of check gates below gaging stations.

The East Side Canal is an exception to the above. Due to numerous waste gates between the intake and Bear Creek, to provide for the passing of water diverted by uncontrolled sloughs and river overflow, it was necessary to locate the measuring station on the canal just above the Stevinson Colony. During flood stages of the river the canal may be supplied entirely by this cross-country water.

The areas served by these diversions consist both of lands cultivated for alfalfa and annual crops, and lands flooded and swamped for wild grass hay and pasturage or for reclamation from alkali. These areas are

held in large tracts, owned by the interests controlling and operating the diversions.

Within the cultivated areas on the west side of the river, there is a complicated interchange of water between canal systems; the lower diversions receive waste water from irrigated areas supplied by higher diversions, and areas served are extensive and irregular in shape, making determination of duty impossible.

The wild grass lands served by the controlled diversions lie principally on the east side of the river. These areas are at best only roughly prepared for swamping by high check levee systems. The areas actually receiving water can be determined only by detailed surveys. The waste and return flow from this swamp irrigation is large, but because it is returned to the river in the same channels with water diverted by uncontrolled sloughs and river overflow it is unmeasurable.

The canals serving this area divert from the river and run north across the trough of the country. There is much interchange of water between canals together with water diverted by uncontrolled sloughs and river overflow. It is not uncommon, during flood stages of the river, for the headgates on lower diversions to remain closed, the canals being supplied entirely by an upper diversion or by a combination of return flow from swamp irrigation, overflow from the river and water diverted by uncontrolled sloughs.

The determination of the duty of water under these conditions is impractical.

Measuring Stations.

Three gaging stations valuable to the investigation are maintained on the San Joaquin River by the United States Geological Survey: one at Friant, one near Newman, below the mouth of the Merced River, and one below the mouth of the Stanislaus. The latter station was established in 1922 for the measurement of return flow from irrigation. A measuring station on the river at the head of Lone Willow Slough is maintained jointly by the San Joaquin Light and Power Corporation, Southern California Edison Company, and Miller and Lux, Incorporated. This station is used principally as a control station for the release of stored water from power reservoirs and for the allotment of water to the canals having the first rights on the river, namely, the San Joaquin and Kings River Canal and Irrigation Company's main canal, and the Chowchilla Canal. The station is of little value during flood flows due to overflow of river banks above the station.

Diversions.

At present there are fifteen controlled gravity canals and sloughs and ten major pumping plants diverting from the San Joaquin River, named in their order down stream as follows:

(1) Gravelly Ford Canal; (2) Aliso Canal; (3) Browns Slough; (4) Lone Willow Slough, Columbia Canal, Chowchilla Canal; (5) Herminghaus Slough and Mowry Canal; (6) Tranquillity Pump No. 1, Fresno Slough; (7) Tranquillity Pump No. 2, Fresno Slough; (8) Firebaugh Canal Pump; (9) Outside Canal; (10) San Joaquin and Kings River (Main) Canal; (11) Helm Canal; (12) Helm Ranch Ditch; (13) Blythe Canal; (14) Temple Slough; (15) Santa Rita

Slough and Pozo Extension Canal; (16) Siphon Slough; (17) East Side Canal; (18) San Luis Island Canal; (19) Patterson Water Company; (20) El Solyo Ranch; (21) Whitehall Estate; (22) Naglee-Burke Irrigation District; (23) West Side Irrigation District; (24) Byron-Bethany Irrigation District; (25) Knightsen Irrigation District and East Contra Costa Water Company.

The diversions in the San Joaquin delta have not been considered within the scope of this survey and have not been investigated.

FRESNO RIVER.

The Fresno River with a drainage area of 272 square miles heads in the low Sierras. Dependent upon rainfall for its water supply, the flow is intermittent, and without storage very undependable for irrigation. The important flow occurs between the months of December and June. The bed of the stream is practically dry during the remainder of the year.

Measuring Stations.

At present there are two gaging stations on the Fresno River, one near Knowles, maintained by the United States Geological Survey, and one at Madera, maintained by the Division of Water Rights.

Diversions.

There are three canals diverting from the Fresno River, namely: Madera Canal and Irrigation Company, Stockton and Bonita canals. The Madera Canal and Irrigation Company serves from 8000 to 10,000 acres annually. The Stockton and Bonita canals are used to irrigate lands on the Bonita and Monte ranches owned by Miller and Lux. The Stockton Canal is used to flood wild pasture land, while the water diverted by the Bonita Canal is used for the irrigation of alfalfa.

CHOWCHILLA RIVER.

The Chowchilla River, draining an area of 268 square miles, is similar in origin and flow to the Fresno River. It flows in a south-westerly course along the northern boundary of Madera County and thence northwesterly to its junction with the San Joaquin. About ten miles below Buchanan the stream forks into three channels: Berenda Slough, Ash Creek and Chowchilla River. During the season of maximum run-off, Ash Creek and Berenda Slough carry the bulk of the flow. The Chowchilla River by means of temporary dams across the bed of Ash Creek carries the entire low water flow.

Measuring Stations.

Three stations are maintained on Chowchilla River by the Division of Water Rights: one in the foothills above Buchanan, the others above and below Sierra Vista Ranch, respectively. The two latter stations are used to determine the water diverted by the Sierra Vista Ranch. Being located below the forks of the stream the measured flow at these stations is not comparable to the flow above Buchanan, except during periods of low flow.

Diversions.

Aside from wild grass irrigation by flooding practiced on the lower reaches of the stream, the only irrigation system on the Chowchilla River is that of the Sierra Vista Ranch near Minturn.

WORK DONE.

Progress in 1920.

June and July were spent in a reconnaissance of the territory and in making intermittent current meter measurement on the various canals and streams within the scope of the investigation. Following the reconnaissance, automatic water stage recorders were installed at the previously selected points on the main diversions as rapidly as possible, and by November 1st twelve such stations were established. Included among these were the five canals diverting water at that season of the year. Three diversions, namely, Henninghouse Slough, Santa Rita Slough and Siphon Slough, presented unfavorable conditions for obtaining continuous records and were not equipped with measuring stations.

Current meter measurements were continued throughout the year on the canals and return flow measurements made on the main San Joaquin and several tributaries.

The results of these measurements are available through the Division of Water Rights in a report entitled "Report of San Joaquin River Hydrographic Survey for 1920."

Progress in 1921.

During 1921 water stage registers were installed on all gravity diversions at previously established measuring stations as soon as the canals began to divert, and a continuous record was kept throughout the year. Current meter gagings were taken on all canals as often as possible, the average being one gaging per week on each canal, to establish station rating curves. In general the canals and sloughs have low gradients and the rating stations are affected by the operation of check gates and the ponding of overflow water below the stations, making frequent measurements necessary.

Measuring stations equipped with staff gages were rated and maintained on Fresno River near Madera, on the three canals diverting from the Fresno River, on the Chowchilla River above and below the Sierra Vista Ranch, and on the Merced River below Livingston.

In addition to the above, measurements were made on the San Joaquin River near Newman in cooperation with the United States Geological Survey, on the lower Merced in the study of return flow and on miscellaneous diversions and tributaries not equipped with rating stations.

The results for 1921 are embodied in a report entitled "Report on San Joaquin River Hydrographic Survey for 1921."

Progress in 1922.

The work during 1922 has been similar to that of 1921.

The measuring stations on the Fresno River, Fresno River diversions, and Chowchilla River, were equipped with water stage registers. Additional stations, equipped with water stage registers, were established on the Chowchilla River above Buchanan and on the San Joaquin and Kings River Canal (Main) one mile below the head. The station on the lower Merced was replaced with a cable station, equipped with a water

stage register, some four miles upstream from its former location at Milliken Bridge. In August an additional water stage register was installed on the Merced River near the mouth for the measurement of return flow from irrigation.

It has been possible, as noted above, to gradually enlarge the field of the investigation during successive seasons. At the same time the accuracy and general reliability of the work has also advanced, the whole without materially increased expense. These results have been brought about through greater efficiency of the engineering staff made possible mainly by close personal contact and familiarity with the numerous problems recounted earlier.

CHAPTER IX.

LEGAL DEPARTMENT.

Character of Work Performed.

The legal work of the Division of Water Rights has grown steadily with the increasing volume of work handled by the Division, until the full time services of an attorney have become necessary. Legal advice is constantly required in connection with every activity of the Division. Questions of great variety and complexity are continually presented by applications filed before the office. Every case referred from a Superior Court involves legal advice and assistance to the Division in fulfilling its function as a referee and each stream system adjudication undertaken has its legal problems for solution. Frequent oral advice is called for by engineers of the Division relative to legal considerations both procedural and substantive; perplexing details of office administration and procedure constantly arise, necessitating interpretations as to the scope and meaning of provisions of the "Water Commission Act," which act has received practically no interpretation by court decision; written opinions are filed on questions of especial importance; contracts are drawn; official orders, certificates, and forms are prepared; conferences and hearings are attended in behalf of the Division; appearance is made in court when necessary; assistance is rendered in the preparation of stipulations for the settlement of water disputes; legal correspondence is conducted by the attorney; and letters, submitted by people from all parts of the state, seeking information relative to the law applicable to water rights and claims, are answered.

California water law is especially difficult of ascertainment due to recognition of both riparian and appropriative rights. The Water Commission Act throws light upon the doctrines of appropriation, but there is no act defining riparian rights and the law relative to both riparian and appropriative rights can be approximated only after reference to numerous court decisions, which are often apparently conflicting in terminology as well as in result. This situation is responsible for a heavy demand for information general and specific on the subject of water rights, and though many of the inquiries made are not clearly within the jurisdiction of the Division, they are, nevertheless, answered and as definitely as possible whenever the Division believes it can be of service in assisting to clear up a water problem. Many intricate questions arise upon which opinion can be given only after careful study.

Legislative reforms and provisions needed are from time to time noted and drafted for enactment. In 1921 bills were presented before the legislature for the purpose of strengthening weak points in the "Act" and making the law more adaptable for service to the water users of the state. These defects come to light only as problems arise. At the next session of the legislature additional changes will be proposed by bills drafted to increase the efficiency of the Division in accomplishing its work.

On large stream systems a problem of practical difficulty remains after water rights have been decreed. Actual distribution of water in times of scarcity necessitates accurate apportionment and fluctuating stream flow demands vigilant head gate adjustment. Obviously one

management is essential to prevent mistake and insure fair play. Also, a decree can only be successful as it is administered. In view of the importance of this work and the increasing demand therefor a study of water master control in other states has been undertaken and is in course of progress with the purpose of formulating any additional legislation on the subject that may appear advisable.

In the above it has been attempted to set forth in a general statement the work conducted by the legal department of the Division and no attempt has been made to go into a detailed review which could be made to occupy many pages and which would not be appropriate in this report. Briefly the work of the legal department along the lines above indicated is increasing along with the volume of work transacted by the Division. This increasing activity is commensurate with the ever growing demand for water and the keener contention for its acquisition and control and for safeguarding rights claimed.

Opportunity for Settlements Out of Court.

As a disinterested body with the means of ascertaining the essential facts of a case without a tedious hearing the Division is able to bring together litigants and prospective litigants where a court with its more formal procedure would fail. In the past, parties in interest or their attorneys and Division representatives, usually the chief, an engineer and the attorney, through the medium of an informal conference, have been able to gather around the table and in the light of facts ascertained by the Division, arrange a settlement by stipulation or agreement. This work has been accomplished with considerable satisfaction to all concerned and with a saving of time and expense that has been very appreciable. A day of conference may save a week of trial and reach a more desirable and final result. This valuable service has been rendered many water claimants, as witness such instances as the San Pedro Creek reference from the Superior Court of San Mateo County and the North Fork of Cottonwood Creek reference from the Superior Court of Shasta County and the Hat Creek reference from the same court which is in course of settlement by stipulation. This method of procedure is also frequently employed to dispose of protested applications and contests arising in the course of adjudication work.

The Tulare Case.

On July 6, 1915, the Tulare Water Company filed an application to appropriate 2000 cubic feet of water per second from Kern River flowing through Buena Vista Slough. September 26, 1919, the executive member of the State Water Commission entered an order rejecting the application, and December 17, 1919, the Commission as a whole affirmed this order of the executive member, which was based upon the conclusion that there was no unappropriated water. The Tulare Water Company thereupon applied to the Superior Court for a writ of mandate. The Superior Court sustained a demurrer to the complaint and held that mandate did not lie. Upon appeal the District Court of Appeal reversed the court below and directed that the demurrer be overruled (34 Cal. App. Dec. 987). Upon hearing before the Supreme Court the trial court was directed to overrule the demurrer and hear the cause on the merits. This decision of the Supreme Court was rendered December 12, 1921, and since that date no action has been

taken by the Tulare Water Company to set the case for trial on the merits. The decision is reported in Volume 187, California Reports, at page 533.

Since the publication of the Tulare case decision a broadcast impression has spread throughout the state which has been frequently and lustily voiced to the effect that the "wings of the Water Commission have been clipped," and that the Division of Water Rights as successor to the State Water Commission has been confined within a narrow field of activity. This impression is without foundation in law or in fact and is based upon the idea that all applicants are entitled to permits, that upon the refusal of a permit an applicant may receive a writ of mandate for the asking, only showing an application in due form, and so compel the issuance of a permit, and that the Division of Water Rights has been deprived of discretion and reduced to a perfunctory organization, a recording office for applications and permits.

The Tulare decision was rendered upon appeal from a ruling on demurrer. The petition alleged facts which established an application in due form for beneficial use and alleged unappropriated water. The demurrer admitted the facts pleaded and therefore admitted that the application was in due form, that it was made for a beneficial use, and that there was unappropriated water. The contention of defendant was that a Water Commission decision was final and that mandamus therefore did not lie. The Supreme Court decision negated this contention. It in effect said that if the Superior Court upon evidence submitted should find that the application was in due form, that it was made for a beneficial use and that there was unappropriated water it should issue a writ of mandate directing the Water Commission to issue a permit. And the Supreme Court therefore overruled the demurrer and directed that the Superior Court hear the evidence as to existence or non-existence of the facts pleaded and admitted by demurrer.

But the Tulare decision does not deprive the Division of the right to investigate and compile data and hold hearings and ascertain the existence or non-existence of unappropriated water and to decide according to its findings of fact; it does not hold that an applicant upon presentation of an application duly executed and in form is entitled to a permit as of right; it does not hold that the presence of unappropriated water is not essential to secure a permit; it does not decide that writs of mandate are available without proving the existence of those facts which entitle a complainant to a certain action by an official body; it does not command the Division to issue a permit; it does not disturb the order rejecting the application of the plaintiff water company.

As to the instant case the decision merely disposes of the demurrer and opens the way for a trial on the merits. It remains for the Tulare Water Company to prove the pre-requisite facts and the Division of Water Rights contends that at least one essential fact does not exist, to wit, unappropriated water.

That the Tulare decision could not reduce the Division of Water Rights to a perfunctory existence can not be disputed for that decision has no relation to two out of three important divisions of work handled by the Division, to wit, stream system adjudication of all appropriative rights involved, and determination by court reference procedure of all water rights whether riparian or appropriative.

That the Tulare decision has not even reduced the Division of Water Rights to a perfunctory existence as regards jurisdiction over applications, is evidenced in the following paragraphs:

The Appellate Court in its decision declared it to be the duty of the Commission to investigate and determine and upon finding no unappropriated water to reject an application, as witness the following language:

“When an application is filed for the appropriation of water of a stream it is incumbent upon the Water Commission to approve the application if it fully complies with the provisions of the act and the necessary facts exist—that is to say, that the water applied for is unappropriated and subject to appropriation and that it is intended to be used for beneficial purposes.”

“But it is not the duty of the Water Commission to approve every application which is in the prescribed form. As it is only water that is subject to appropriation, or is unappropriated, that may be applied for under the act, the commission must investigate under section 10 of the act, and determine whether the water applied for is in fact subject to appropriation or is unappropriated. If any of the essential facts necessary for the approval of the application are wanting, it is the duty of the Commission to refuse to approve it. But neither the approval or rejection of an application is a final judgment reached after a hearing and determination of the question involved.”

The Supreme Court did not negative the expression above quoted from the Appellate Decision and the Supreme Court decision is authority only on the point at issue, to wit, whether on facts pleaded and admitted by demurrer (an application in due form, unappropriated water, beneficial use) a writ of mandate lies.

The application stands rejected today months after the decision. Were a writ of mandate issuable upon merely showing an application in due form certainly the company would have asked for it. This long delay seems to indicate the interposition of legal obstacles between the Tulare decision and a writ, and one chief obstacle, it is maintained, is the proof of unappropriated water.

The Division of Water Rights has continued to function without hindrance, and as extensively, vigorously, and efficiently as ever did the Water Commission. Its investigation work towards determination of existence or non-existence of unappropriated water in connection with applications to appropriate continues and the evidence resultant from such work will assist in reaching a correct final determination in such cases as may be reviewed by the courts. Also, the value of such technical investigation of purely physical problems is everywhere admitted and this very work in nearly all cases satisfies applicants whose applications are rejected, because the water applied for does not exist.

In conclusion it is here pointed out that as a matter of law the Division of Water Rights has not been restricted in scope of operation and that as a matter of fact no determination of the Division has yet been reversed and that though its determinations are subject to review we are not for that reason impotent. Court decisions are also subject to review by higher courts.

CHAPTER X.

UNDERGROUND WATER DEVELOPMENT.

The general subject of underground water and its great and increasing importance in California needs no comment, as the trend of development in this direction is well known. With the tremendous increase in pumping from ground water in recent years, however, a series of new problems, both physical and legal, have been encountered, and with the solution of these problems the Division of Water Rights must necessarily be intimately connected.

The conflicts arising over the ownership and use of water flowing on the surface of the ground can be, and have been in many cases in California, most distressing and injurious to the best interests of the state. Here, the physical facts can be directly ascertained. How much greater then is the possibility of misunderstanding or conflict over the use of an underground supply, where the facts are always obscure and in some cases not susceptible of close determination.

The question of how to proceed with the fullest possible utilization of the remaining underground sources of supply without a repetition of the earlier conflicts over surface rights or possible loss of capital through ill-advised projects is occupying the attention of many individuals and concerns in this state at the present time. This is particularly true in the southern part, where, most surface supplies having been appropriated many years ago, later projects have been forced to depend on the underflow for their water supplies. This chapter will be devoted to a discussion of the more recent problems brought to the attention of the Division.

By far the greater part of the use of underground water for irrigation has come about since 1899. In the decade since 1909 the increase has been specially marked and two-thirds of the 868,000 acres so irrigated at the time of the last census has been developed in the last ten years.

The following table, taken from data gathered by the United States Census Bureau, shows for the last three census dates the total acreage irrigated in the state as compared with the total irrigated by pumping from underground sources. It is especially noteworthy that while in the last decade the total irrigated area has increased fifty-four per cent the area irrigated from underground water has increased two hundred and fourteen per cent, almost exactly four times as fast. It is also noteworthy that while in 1909 only ten per cent of the total area was irrigated from underground sources, this had increased to twenty-one per cent in 1919.

TABLE 6.
Increase in Irrigated Acreage in California.

Year	Total acreage irrigated	Acreage irrigated from underground sources
1899 -----	1,446,000	153,000
1909 -----	2,664,000	277,000
1919 -----	4,095,000	868,000
Increase	Per cent	Per cent
1909-1919 -----	54	214

The subject must be considered in both its physical and legal aspects. In a surface water problem the physical facts, while often intricate

and difficult to obtain, can after all be obtained with sufficient accuracy, and it is the awkward and involved legal situation involving the opposing doctrines of prior appropriation and of riparian rights, that creates the most serious obstacles to harmonious development. With underground water the case is exactly the reverse. The physical facts can be approximated only with great difficulty while the legal situation on the other hand is comparatively clear.

Legal Aspects.

As laid down by the courts, the rule governing the use of underground waters is, briefly, that a natural ground water supply is a common benefit for all overlying lands, and that each land owner is entitled to a reasonable use from this supply in common with all other overlying land owners. Use of the ground water supply is also allowed on distant lands when there is a surplus over and above the reasonable use of the overlying land owners.

It will be seen that the above rule allows a wide use of the underground water supplies, and does not restrict it to a few fortunate individuals owning land along a stream, as does the riparian doctrine. It affords the basis for the orderly development and distribution of all such sources of supply, which development as indicated by the figures quoted, is increasing rapidly, and is of the greatest importance to the progress and prosperity of the whole state.

This rule of the courts has not, however, been followed by delegating definitely to an administrative body the duty of applying its admirable principles. The Water Commission Act, under which the Division of Water Rights functions, states in section 42 in part as follows:

“Whenever the terms stream, stream system, lake or other body of water or water occurs in this act, such term shall be interpreted to refer only to surface water, and to subterranean streams flowing through known and definite channels”.

This definition is not at all clear legally, and it is manifestly impossible for the Division, when receiving applications, to investigate each case and determine whether or not the water applied for is “flowing through known and definite channels”. It is the practice of the Division to notify parties desiring to file applications for underground water of the limitations of section 42 and to further advise them as follows:

“It is therefore unnecessary to apply if the waters to be developed are merely percolating waters. The Division of Water Rights advises, however, that application be made even in the case of percolating waters developed on the public domain (by boring wells, driving tunnels, or other methods) so that the applicant may have a stronger ‘record protection’ in case conflict later arises with others who enter the public land upon which the development is situated”.

If, after receipt of this letter, the party still desires to file an application, it is accepted and filed in the regular manner and acted on in due time. Large numbers of such applications have been received, indicating a general desire for state supervision of underground water supplies.

Physical Aspects.

The impression prevailed generally in the past, and still persists to an unfortunate extent that the supply of underground water is inexhaustible, on account of the great depth and extent of some of the underground basins. It is clear, however, that over a period of years, no more water can be drawn out of the ground than goes into it, without a gradual lowering of the level of the water surface, and an eventual depletion of the basin.

The amount of water being supplied to the underground basin each year, or annual replenishment, is the first item to be taken up in the technical investigation of a ground water situation. This replenishment consists mainly of the percolation from the channels of the stream or streams traversing the basin. To obtain the amount of the percolation necessitates stream measurements of great accuracy, since it is often but a small percentage of the total flow. Inaccuracies may be introduced by the fact that there are other sources of replenishment than percolation from the stream beds. Such sources might be direct accretion to the ground water from rainfall on the basin, from flood run-off of minor streams and gullies, which as a practical matter are unmeasurable, return water from irrigation of overlying land, supplies from inter-connected adjacent basins, etc.

The amount of water withdrawn from the basin, or the annual draft, must also be obtained. This consists first of the direct draft by pumping for irrigation and domestic use, which is readily ascertainable. Springs, swamps or artesian wells may be the cause of additional drafts. Evaporation from the surface of the ground or from swamps is difficult to estimate accurately, but may be the cause of a large loss from the underground supply, and finally, if the basin is not of the "closed" type, that is, if there is an underground outlet to a lower basin or to the ocean, a very large draft may exist which it may not be possible to directly measure.
